HARRISBURG, PA.

VOL. XLVIII. JANUARY, 1943. No. 1.

GENERAL SUMMARY.

Mountain and northern stations generally reported temperatures below station normals, but elsewhere excesses were accumulated. As a result, the average for the State was 0.8° higher than that of December, 1942, and was only slightly below the January 56-year average. Highest temperatures of the month were reported by most stations about the 25th, although at some southeastern points, they occurred about the 16th. The extreme maximum was the highest for any January since 1932.

Precipitation was well distributed throughout the month but was generally in small amounts. Only scattered stations reported amounts in excess of their normals. Much of the precipitation fell in the form of snow. Traffic was retarded but no serious accidents were reported. Greatest amounts fell about the 28th, excepting at some western stations. Freezing rain was reported by most stations about the 2d and 17th. Forming a thin coating of ice on highways, it created hazardous road conditions which caused numerous minor accidents. An ice storm in Wayne County on the 18th and 19th did considerable damage to trees and power lines. Ice was reported to have formed on wires to a thickness of 3.25 inches. Sleet was reported on a number of days. Thunderstorms occurred at most stations about the 18th.

High winds were reported on several dates but the most damaging occurred about the 19th. In south-central counties, particularly, some property damage resulted when the wind blew down trees, felled electric wires, and damaged buildings.

G. W. S

TEMPERATURE.

The mean temperature for the State, as determined from the reports of 74 stations, was 28.2°, which is 0.1° below the 56-year normal for January. The highest monthly mean was 34.6° at Donora, Washington County, and the lowest was 19.5° at Montrose, Susquehanna County. Extremes ranged from a maximum of 73° at Greensburg, Westmoreland County, on the 25th, to a minimum of −12° at Coudersport, Potter County, on the 9th.

PRECIPITATION.

The average precipitation for the State, as determined from the observations at 188 stations, was 2.68 inches, which is 0.50 inch below the 56-year normal for January. The greatest monthly amount was 4.85 inches at Laurel Hill Tunnel, Westmoreland County, and the least was 0.93 inch at Erie, Erie County. The greatest amount recorded in any 24 consecutive hours was 1.88 inches at Philadelphia, Philadelphia County, on the 28th.

The average snowfall for the State was 15.5 inches, which is 5.0 inches above the 56-year normal. The greatest monthly snowfall was 33.0 inches at Johnstown, Cambria County. The greatest fall for any observational day was 15.0 inches at York Haven, York County, on the 29th.

For cooperative stations the departure from normal temperatures are computed from averages of entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 or more years of record are computed from a normal or "standard mean," adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for period of record are used. † On other dates also. § Incomplete. // Total partially estimated. * Estimated. T.(trace) indicates precipitation less than .01 inch. Reference letters, [a], [b], [c], etc., indicate, respectively, 1, 2, 3, etc., missing from the record. ‖ From all available records.

Except as otherwise indicated, observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation. [1] First order Weather Bureau station; precipitation is for 24-hour period, midnight to midnight, unless otherwise indicated. [2] Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. [3] Precipitation for period, midnight to midnight. [4] Precipitation for period, noon to noon. [5] Precipitation for period, 1:30 a. m. of date on which amount is recorded to 1:30 a. m. following date. ‡ Precipitation measured with recording gage, midnight to midnight. * Included in next measurement. § Incomplete or missing. † Daily amounts inconsistent. T. (trace), when precipitation is less than .01 inch. ‖ Record partially estimated.

CLIMATOLOGICAL DATA

L. F. CONOVER

HARRISBURG, PA.

VOL. XLVIII. FEBRUARY, 1943. No. 2.

GENERAL SUMMARY.

The average temperature for the State was well above normal and an average daily excess of 0.7° has been accumulated this year. This is in contrast to 1942 when, in the same period, there was a deficiency of 1.7°. All but a few scattered stations reported averages above their normals. Maxima were reported by most stations about the 23d, while minima occurred, generally, about the 15th. Extremes were well within the range of February absolute temperatures.

Precipitation was frequent but light falls brought the average for the State to slightly over half the normal amount. During the first two months of the year, a deficiency of 1.61 inches has been accumulated. With the exception of a small area in the northwest portion, stations reported amounts below their normals.

Snow was reported frequently but amounts were comparatively small. Some inconvenience was reported about the middle of the month when high winds drifted moderate amounts of snow. The snow cover decreased steadily and was generally inadequate.

Sleet and glaze were reported on scattered dates but caused only local difficulties. Thunderstorms were reported by many western stations about the 4th and 20th and at some eastern stations about the 24th. High winds were reported on various dates.

Streams rose somewhat toward the end of the month but crested well under flood stages. One child was drowned when a small bridge on which he was standing was struck by ice and swept away. Three boys were drowned when they went boating in a swollen river near Lewistown.

G. W. S

TEMPERATURE.

The mean temperature for the State, as determined from the reports of 74 stations, was 29.9°, which is 1.5° above the 56-year normal for February. The highest monthly mean was 37.4° at Marcus Hook, Delaware County, and the lowest was 22.4° at Kane, McKean County. Extremes ranged from a maximum of 75° at Phoenixville, Chester County, on the 24th, to a minimum of −27° on the 15th at Bradford and Kane, both in McKean County.

PRECIPITATION.

The average precipitation for the State, as determined from the observations at 188 stations, was 1.71 inches, which is 1.11 inches below the 56-year normal for February. The greatest monthly amount was 3.33 inches at Warren, Warren County, and the least was 0.49 inch at Lawrenceville, Tioga County. The greatest amount recorded in any 24 consecutive hours was 0.90 inch at Mercer, Mercer County, on the 10th.

The average snowfall for the State was 7.8 inches, which is 2.9 inches below the 56-year normal. The greatest monthly snowfall was 25.1 inches at Johnstown, Cambria County. The greatest fall for any observational day was 7.0 inches on the 8th at Warren, Warren County, and on the 27th at Lebanon, Lebanon County; Orangeville, Columbia County; and Pottsville, Schuylkill County.

ERRATA

Annual, 1942.—Page 88, Dushore, total precipitation for December should be 4.44 inches; total annual precipitation should be 38.65 inches.

Annual, 1942.—Page 89, East Waterford, total precipitation should be 47.85 inches.

October 21, 1942 to January 31, 1943.—Marienville's precipitation data for this period are questionable.

For cooperative stations the departure from normal temperatures are computed from averages of entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 or more years of record are computed from a normal or "standard mean," adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for period of record are used. † On other dates also. § Incomplete. ‖ Total partially estimated. * Estimated. T.(trace) indicates precipitation less than .01 inch. Reference letters, [a], [b], [c], etc., indicate, respectively, 1, 2, 3, etc., missing from the record.

Except as otherwise indicated, observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation. [1] First order Weather Bureau station; precipitation is for 24-hour period, midnight to midnight, unless otherwise indicated. [2] Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. [3] Precipitation for period, midnight to midnight. [4] Precipitation for period, noon to noon. [5] Precipitation for period, 1:30 a. m. of date on which amount is recorded to 1:30 a. m. following date. ‡ Precipitation measured with recording gage, midnight to midnight. * Included in next measurement. § Incomplete or missing. † Daily amounts inconsistent. T. (trace), when precipitation is less than .01 inch. ‖ Record partially estimated.

HARRISBURG, PA.

VOL. XLVIII. MARCH, 1943. No. 3.

GENERAL SUMMARY.

Temperatures averaged slightly below normal and reduced the accumulated average daily excess for the year to 0.3°. Most stations recorded their lowest temperatures on the 4th and the extreme minimum for the month was the lowest since 1934. The maxima of the 31st were generally the highest of the month, although a number of stations in the southwest had equally high temperatures on the 16th.

Precipitation, frequent and well distributed until the 20th, was generally in light amounts and the average was again below normal. This was the third month in which precipitation was deficient. The average for March was about one inch higher than that for February and the accumulated deficiency for the year is now 2.37 inches. Frequent snow during the early part of the month accumulated a total close to normal but the average for the State was less than half that of March, 1942. At a majority of stations, the greatest 24-hour amounts fell in the storm of the 6th. Sleet and glaze were reported by most stations during the first half of March. Hail fell at scattered stations.

High winds were reported on a number of days and thunderstorms occurred at many southern and eastern stations about the 17th. Heavy fog was reported by many stations, and, on the 20th, caused accidents in the Philadelphia area which resulted in one death and three injuries. Earth tremors were felt in the western part of the State on the 8th.

Although snowfall, during the past winter, exceeded the average by four inches, wintering crops received inadequate protection. Periods of thawing which depleted the snow cover alternated with periods of freezing in which the crops were damaged. By the end of March, the varying temperatures and the muddy fields had delayed farm work so that it was approximately ten days late.

G. W. S

TEMPERATURE.

The mean temperature for the State, as determined from the reports of 75 stations, was 37.2,° which is 0.4° below the 56-year normal for March. The highest monthly mean was 44.7° at Phoenixville, Chester County, and the lowest was 29.8° at Montrose, Susquehanna County. Extremes ranged from a maximum of 85° at Phoenixville, Chester County, on the 31st, to a minimum of −15° at Bradford, McKean County, and Philipsburg, Centre County, on the 9th.

PRECIPITATION.

The average precipitation for the State, as determined from the observations at 196 stations, was 2.74 inches, which is 0.76 inch below the 56-year normal for March. The greatest monthly amount was 4.39 inches at Manada Gap, Dauphin County, and the least was 1.54 inches at Ansonia, Tioga County. The greatest amount for any 24 consecutive hours was 2.25 inches at McKeesport, Allegheny County, on the 5th and 6th.

The average snowfall for the State was 7.2 inches, which is 0.7 inch below the 56-year normal. The greatest monthly snowfall was 16.9 inches at South Mountain, Franklin County. The greatest fall for any observational day was 9.0 inches at Burnt Cabins, Huntingdon County, on the 6th.

ERRATA

July, 1942.—Page 41, Pittsburgh Airport, mean temperature should be 74.9°, departure should be +0.1°. Page 46, Clarion, precipitation on the 28th should be 0.01 inch. Ebensburg, precipitation on the 20th should be 0.20 inch; Sunbury, amount on the 23d should be 0.46 inch, total should be 4.84 inches. Page 47, Confluence, total precipitation should be 3.47 inches; Connellsville, total precipitation should be 2.85 inches.

August, 1942.—Page 52, Fredericksville, precipitation on 1st should be 0.45 inch, total should be 10.63 inches; Mt. Pocono, precipitation on 9th should be 2.20 inches. Page 53, Kingtown, precipitation on 15th should be 0.04 inch. Page 55, Butler, maximum temperature on 8th should be 79°, mean maximum should be 82.6°; Meadville, minimum temperature on 3d should be 60°. Page 56, New Castle, maximum temperature on 3d should be 89°; Pittsburgh Airport, minimum temperature on 30th should be 62°.

For cooperative stations the departure from normal temperatures are computed from averages of entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 or more years of record are computed from a normal or "standard mean," adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for period of record are used. † On other dates also. § Incomplete. ‖ Total partially estimated. * Estimated. T.(trace) indicates precipitation less than .01 inch. Reference letters, ª, ᵇ, ᶜ, etc., indicate, respectively, 1, 2, 3, etc., missing from the record.

‡‡ Formerly Bloomsburg [near]

Except as otherwise indicated, observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation. [1] First order Weather Bureau station; precipitation is for 24-hour period, midnight to midnight, unless otherwise indicated. [2] Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. [3] Precipitation for period, midnight to midnight. [4] Precipitation for period, noon to noon. [5] Precipitation for period, 1:30 a. m. of date on which amount is recorded to 1:30 a. m. following date. ‡ Precipitation measured with recording gage, midnight to midnight. * Included in next measurement. § Incomplete or missing. † Daily amounts inconsistent. T. (trace), when precipitation is less than .01 inch. ‖ Record partially estimated.

Unless otherwise noted temperatures noted represent extremes for 24-hour period ending in late afternoon. [2] Thermometers read in morning, maximum set back to preceding date. [3] Midnight to midnight. [5] 1:30 a. m. to 1:30 a. m. [a], [b], [c], etc., indicate respectively 1, 2 or 3 days missing from record.

U. S. DEPARTMENT OF COMMERCE, WEATHER BUREAU

CLIMATOLOGICAL DATA

L. F. CONOVER

HARRISBURG, PA.

VOL. XLVIII. APRIL, 1943. No. 4.

GENERAL SUMMARY.

April was wet and unusually cold, offering an unpleasant contrast to the weather usually associated with the month. The average temperature was the lowest obtained for the State in the period of record for April. There is now an accumulated average daily deficiency for the year of 1.2° and daily temperatures have averaged 2.0° lower than they did in a comparable period in 1942. All stations contributed to the deficiency and all experienced sub-freezing temperatures. Extreme maxima, occurring about the 25th, were below those reported in March at all but eight stations, most of which were in the extreme east portion. Only three times, in the period of record, has the extreme maximum in April been lower. Minima occurred, generally, in the first half of the month and the extreme minimum was the lowest since 1924.

Precipitation was frequent, and for the first time this year, the State average was above normal, reducing the accumulated deficiency for the year to 1.82 inches This deficiency is only 0.01 inch greater than that accumulated during the first four months of 1942. Precipitation was above normal at most stations, the exceptions being the east and south portions. Greatest amounts fell during the period 18th-21st, most stations recording their greatest 24-hour rainfall measurements during that interval. In the Bradford area, heavy precipitation on the 27th caused streams to rise rapidly, flooding low-lying areas. Streams were flooded when sewers, blocked by debris, were unable to carry away the excess water. Damage to property and gardens resulted.

Light sleet and some glaze were reported, generally, in the early part of the month. Light hail fell in thunderstorms which were reported on a number of days. Most general were those about the 20th. Snow was frequent in the first part of the month, and excepting 1942, the average was higher than in any April since 1928. It offered no protection, melting as it fell or shortly thereafter.

Another unusual feature of the month was the frequency of high winds, which in contrast to normal years, were more general than they were in March. They caused minor damage to property.

Farm activity was approximately ten days behind the stage usually reached by the end of April. The unusually low temperatures and wet ground kept outdoor work to a minimum and retarded the growth of vegetation. Undetermined damage to winter crops and fruits had resulted from the recurrent freezing temperatures.

G. W. S.

TEMPERATURE.

The mean temperature for the State, as determined from the reports of 76 stations, was 43.1°, which is 5.5° below the 56-year normal for April. The highest monthly mean was 51.2° at Phoenixville, Chester County, and the lowest was 35.2° at Kane, McKean County. Extremes ranged from a maximum of 83° at Lancaster, Lancaster County, on the 1st and Phoenixville, Chester County, on the 26th, to a minimum of 7° at Kane on the 7th and Bradford, McKean County, on the 16th.

PRECIPITATION.

The average precipitation for the State, as determined from the observations at 193 stations, was 3.97 inches, which is 0.55 inch above the 56-year normal for April. The greatest monthly amount was 7.00 inches at Philipsburg, Centre County, and the least was 2.05 inches at Philadelphia City Office, Philadelphia County. The greatest amount for any observational day was 2.53 inches at Driftwood, Cameron County, on the 20th-21st.

The average snowfall for the State was 3.7 inches, which is 1.5 inches above the 56-year normal. The greatest monthly snowfall was 23.8 inches at Tamarack, Clinton County. The greatest fall for any observational day was 8.3 inches at Shaffer's Path, Lycoming County, on the 17th.

For cooperative stations the departure from normal temperatures are computed from averages of entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 or more years of record are computed from a normal or "standard mean," adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for period of record are used. † On other dates also. § Incomplete. ‖ Total partially estimated. * Estimated. T.(trace) indicates precipitation less than .01 inch. Reference letters, [a], [b], [c], etc., indicate, respectively, 1, 2, 3, etc., missing from the record.

†† Formerly Bloomsburg [near]

Except as otherwise indicated, observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation. [1] First order Weather Bureau station; precipitation is for 24-hour period, midnight to midnight, unless otherwise indicated. [2] Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. [3] Precipitation for period, midnight to midnight. [4] Precipitation for period, noon to noon. [5] Precipitation for period, 1:30 a. m. of date on which amount is recorded to 1:30 a. m. following date. ‡ Precipitation measured with recording gage, midnight to midnight. * Included in next measurement. § Incomplete or missing. † Daily amounts inconsistent. T. (trace), when precipitation is less than .01 inch. ‖ Record partially estimated.
** Boswell was formally Laurel Hill Summit. Figures and letters following station indicate distance and direction of station from the city or town.

CLIMATOLOGICAL DATA

L. F. CONOVER

HARRISBURG, PA.

VOL. XLVIII. MAY, 1943. No. 5.

GENERAL SUMMARY.

Although temperatures averaged only slightly above normal, the contrast with April's abnormally cold weather was a pleasant one. The accumulated average daily deficiency for the year was reduced to 0.8°, but the average daily temperature for the year is 2.0° below that obtained for the comparable period in 1942. Highest temperatures occurred in the early part of the month, reaching 90° at relatively few stations. Minima of 32° or lower were reported at all but a few stations, most of which were in the extreme southeast portion. The extreme minimum was the lowest May temperature since 1931.

Frequent precipitation produced the highest May average since 1908. The average exceeded by 0.20 inch that of May, 1942. The average number of days on which measurable amounts of rain fell equaled the May record, which was established in 1933. At many stations, particularly in the west portion, measurable precipitation was reported on 20 days, Uniontown obtaining measurements on 24 days. The accumulated excess for the year is now 0.37 inch.

Heavy rain caused flooding of low-lying areas, and resulted in damage to farms, highways, and gardens. Near Scranton, on the 18th, two temporary bridges were washed out by rain-swollen streams. In the Johnsonburg area, heavy rains on the night of the 25th, caused streams to rise suddenly. Over 100 feet of roadbed of the Pennsylvania Railroad were washed out and a freight train was derailed. Many families were driven from their homes.

Thunderstorms were frequent, most general being those of May 18-20th. Lightning killed three men and started fires which resulted in property damage of at least $25,000. High winds caused many power interruptions as trees and branches were blown down, breaking the lines. Four additional deaths and two injuries were attributed to accidents caused by storm damage.

Snow was reported by many stations on the 1st, but amounts were measurable only at South Mountain and at Springs, where 0.1 inch and 0.3 inch respectively, were reported.

TEMPERATURE.

The mean temperature for the State, as determined from the reports of 75 stations, was 60.4°, which is 0.7° above the 56-year normal for April. The highest monthly mean was 65.7° at Marcus Hook, and the lowest was 53.2° at Kane. Extremes ranged from a maximum of 93° at Marcus Hook, on the 7th, to a minimum of 19° at Butler, on the 1st and 2d.

PRECIPITATION.

The average precipitation for the State, as determined from the observations at 198 stations, was 6.08 inches, which is 2.19 inches above the 56-year normal for May. The greatest monthly amount was 10.34 inches at Gratersford, and the least was 3.59 inches at Woodward. The greatest 24-hour amount was 3.23 inches at Gratersford on the 26th.

ERRATA

November, 1942.—Page 72, Burnt Cabins, number of cloudy days should be 13. Page 73, Freeland, precipitation entry on 1st should be "*". Page 75, Mt. Lebanon, precipitation total should be 2.88 inches. Page 76, Freeland, minimum temperature on 13th should be 25°; Indiana, minimum temperature on the 26th should be 29°. Page 77, Phoenixville, minimum temperature on the 1st should be 53°.

December, 1942.—Page 79, Uniontown, maximum should be 59°. Page 80, Williamsport, precipitation on the 6th should be 0.02 inch.

March, 1943.—Page 20, Coudersport, minimum temperature on the 5th should be 20°.

For cooperative stations the departure from normal temperatures are computed from averages of entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 or more years of record are computed from a normal or "standard mean," adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for period of record are used. † On other dates also. § Incomplete. ‖ Total partially estimated. * Estimated. T.(trace) indicates precipitation less than .01 inch. Reference letters, a, b, c, etc., indicate, respectively, 1, 2, 3, etc., missing from the record.

Figures and letters following station indicate distance and direction from the city and replace the previous designation 'near'. Locations not appearing here are shown in the Daily Precipitation Table.

‡ Philipsburg is Black Moshannon Airport. ‡‡ Formerly Bloomsburg [near]

Except as otherwise indicated, observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation. [1] First order Weather Bureau station; precipitation is for 24-hour period, midnight to midnight, unless otherwise indicated. [2] Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. [3] Precipitation for period, midnight to midnight. [4] Precipitation for period, noon to noon. [5] Precipitation for period, 1:30 a. m. of date on which amount is recorded to 1:30 a. m. following date. [6] Observation taken at a fixed hour between sunset and 11:00 p. m. ‡ Precipitation measured with recording gage, midnight to midnight. * Included in next measurement. § Incomplete or missing. † Daily amounts inconsistent. T. (trace), when precipitation is less than .01 inch. ‖ Record partially estimated. ** Boswell was formally Laurel Hill Summit.

HARRISBURG, PA.

VOL. XLVIII. JUNE, 1943. No. 6.

GENERAL SUMMARY.

June was a month of extreme and violent weather. It was the hottest June in the period of record, and thunderstorms approached a frequency of one day out of every two. Forty-eight deaths were reported, which were attributed, directly or indirectly, to the weather.

In spite of the high average, extreme maxima were well below the records established in 1934, when the previous record high average was established. While an average daily surplus of 4.8° was built up during the month, the accumulated average daily excess for the first six months of the year is only 0.2°. Temperatures were generally above 90° from the 20th to the 28th, extremes occurring at most stations about the 25-28th. Cases of heat prostration, which were common throughout the month, increased sharply during the latter part. Twenty-six deaths were attributed to heat about the 27th, in contrast to seventeen from the 1st to the 26th. The heat wave was definitely broken by the 29th, and as the month closed, temperatures were approaching record summer lows.

Precipitation was adequate and well distributed until the 17th, but was spotty and of little consequence thereafter until the last few days of the month, and the State average was the lowest obtained for any June since 1933. The accumulated precipitation for the year is now 0.42 inch deficient. Thunderstorms, most general about the 17th and at the close of the month, were severe, much local damage resulting from lightning, wind, and heavy rain. Lightning killed three persons and injured a number of others. Reports of property damage were numerous. Many fires were started, utility interruptions were frequent, and some livestock were killed. Four deaths occurred in accidents caused by high winds. Heavy rain caused sudden flooding in some communities as drainage systems were overtaxed. Fields were eroded and crops and gardens were washed out. Hail, reported at scattered stations, was the size of hickory nuts on the 10th at Lock Haven, where it broke windows and damaged crops. On the 13th, hail the size of golf balls fell at Meckville, Berks County.

Crops and field work were still behind their normal stages at the end of the month. The excellent growing weather had partially counteracted the effects of an abnormally cold April, but the lack of rain was becoming increasingly apparent, as reserves, built up during excessively wet May, dwindled. The adverse affect of the cold winter and spring weather on winter grains and fruits was becoming apparent.

TEMPERATURE.

The mean temperature for the State, as determined from the reports of 77 stations, was 73.0°, which is 4.8° above the 56-year normal for June. The highest monthly mean was 79.7° at Marcus Hook, and the lowest was 66.3° at Kane. Extremes ranged from a maximum of 101° at Phoenixville, on the 4th and 25th to a minimum of 35° at Kane, on the 30th.

PRECIPITATION.

The average precipitation for the State, as determined from the observations at 201 stations, was 3.33 inches, which is 0.79 inch below the 56-year normal for June. The greatest monthly amount was 7.11 inches at Sharon, and the least, 0.71 inch at Hyndman. The greatest 24-hour amount was 3.05 inches at Susquehanna on the 17th.

For cooperative stations the departure from normal temperatures are computed from averages of entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 or more years of record are computed from a normal or "standard mean," adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for period of record are used. † On other dates also. § Incomplete. ‖ Total partially estimated. * Estimated. T.(trace) indicates precipitation less than .01 inch. Reference letters, [a], [b], [c], etc., indicate, respectively, 1, 2, 3, etc., missing from therecord.

Figures and letters following station indicate distance and direction from the city and replace the previous designation 'near'. Locations not appearing here are shown in the Daily Precipitation Table.

‡ Philipsburg is Black Moshannon Airport. †† Formerly Bloomsburg [near]

Except as otherwise indicated, observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation. [1] First order Weather Bureau station; precipitation is for 24-hour period, midnight to midnight, unless otherwise indicated. [2] Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. [3] Precipitation for period, midnight to midnight. [4] Precipitation for period, noon to noon. [5] Precipitation for period, 1:30 a. m. of date on which amount is recorded to 1:30 a. m. following date. [6] Observation taken at a fixed hour between sunset and 11:00 p.m. ‡ Precipitation measured with recording gage, midnight to midnight. * Included in next measurement. § Incomplete or missing. † Daily amounts inconsistent. T.(trace), when precipitation is less than .01 inch. ‖ Record partially estimated. ** Boswell was formally Laurel Hill Summit.

CLIMATOLOGICAL DATA

L. F. CONOVER

HARRISBURG, PA.

VOL. XLVIII. JULY, 1943. No. 7.

GENERAL SUMMARY.

July brought a return to more seasonal weather as temperatures averaged only slightly above normal. The accumulated average daily excess for the year remains 0.2°. All stations, excepting Erie and Pymatuning Dam, reported extremes below those of June. Lowest temperatures occurred on the 1st when killing frosts were reported in a few mountain areas and new record minima for July were established at scattered points. Among these were Philadelphia and Harrisburg, with records of 73 and 55 years, respectively. Only twice, in the period of record for July, has the extreme minimum been lower than the 31° reported at Black Moshannon Airport in Centre County.

The precipitation average was above normal, reducing the accumulated deficiency for the year to 0.24 inch. Amounts varied greatly, large excesses accumulating in the southwest while the southeast suffered from a deficiency. Claysville experienced its wettest month, exceeding by 1.76 inches its previous monthly record of 9.55 inches which was established in January, 1937. Heavy rain, violent thunderstorms, and high winds combined to bring property damage to well over a million dollars.

The most damaging storm was that in the Pittsburgh and Claysville areas on the 27-28th. Mt. Lebanon reported 4.18 inches in 24 hours, and at Claysville a new 24-hour record of 5.04 inches was established. Of this amount, 4.56 inches fell in three hours. The excessive rains caused sudden local flooding. Properties along streams suffered extensive damage, bridges were washed away, and roads were inundated. High water flooded a mine, trapping six workmen for 48 hours. Minor flooding also damaged property in Washington County on the 7th and in southern York County on the 12th.

Thunderstorms, most general about the middle and end of July, contributed heavily to property damage. Lightning killed two boys at Butler on the 14th and a man at Clearfield on the 27th. Loss from fires started by lightning was high. Many power interruptions were caused by lightning and high winds, when wires were broken by blown branches and trees. On the 20th, a number of stations in the east portion reported hail of unusual size. Near Phoenixville hail stones "the size of baseballs" were reported. Crop damage was heavy.

On the 29th, small tornadoes were reported at Oil City and at Pleasantville, both in Venango County. At Oil City two people were injured and property damage was estimated at $45,000.

G. W. S.

TEMPERATURE.

The mean temperature for the State, as determined from the reports of 76 stations, was 72.6°, which is 0.4° above the 56-year normal for July. The highest monthly mean was 79.3° at Marcus Hook, and the lowest was 66.2° at Springs. Extremes ranged from a maximum of 100° at Phoenixville, on the 22d, to a minimum of 31° at Philipsburg on the 1st.

PRECIPITATION.

The average precipitation for the State, as determined from the observations at 196 stations, was 4.47 inches, which is 0.18 inch above the 56-year normal for July. The greatest monthly amount was 11.31 inches at Claysville, and the least, 1.27 inches at Hewitt. The greatest 24-hour amount was 5.04 inches at Claysville on the 27-28th.

For cooperative stations the departure from normal temperatures are computed from averages of entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 or more years of record are computed from a normal or "standard mean," adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for period of record are used. † On other dates also. § Incomplete. ‖ Total partially estimated. * Estimated. T.(trace) indicates precipitation less than .01 inch. Reference letters, [a], [b], [c], etc., indicate, respectively, 1, 2, 3, etc., missing from therecord.

Figures and letters following station shown in the Daily Precipitation Table. indicate distance and direction from the city and replace the previous designation 'near'. Locations not appearing here are

‡ Philipsburg is Black Moshannon Airport.

Except as otherwise indicated, observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation. [1] First order Weather Bureau station; precipitation is for 24-hour period, midnight to midnight, unless otherwise indicated. [2] Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. [3] Precipitation for period, midnight to midnight. [4] Precipitation for period, noon to noon. [5] Precipitation for period, 1:30 a. m. of date on which amount is recorded to 1:30 a. m. following date. [6] Observation taken at a fixed hour between sunset and 11:00 p.m. ‡ Precipitation measured with recording gage, midnight to midnight. * Included in next measurement. § Incomplete or missing. † Daily amounts inconsistent. T. (trace), when precipitation is less than .01 inch. ‖ Record partially estimated. ** Boswell was formerly Laurel Hill Summit. §§ Ford City was formerly Crooked Creek Dam. ‖‖ Putneyville was formerly Mahoning Dam.

U. S. DEPARTMENT OF COMMERCE, WEATHER BUREAU

CLIMATOLOGICAL DATA

L. F. CONOVER

HARRISBURG, PA.

VOL. XLVIII. AUGUST, 1943. No. 8.

GENERAL SUMMARY.

The average temperature was above normal for the fourth consecutive month, but since the surplus was slight the accumulated average daily excess for the year remains 0.2°. The first half of the month was hot and extreme maxima, recorded by most stations about the 12th, were generally higher than those of July. Extreme minima occurred at practically all stations on the 19th. Averages were above station normals, excepting at a few southwestern and mountain stations.

Precipitation occurred with near-normal frequency but, with a few exceptions, amounts were light and only a few northern and western stations had surpluses. The State average was the lowest obtained in any August since 1930 and the accumulated deficiency for the year rose to 1.72 inches. Greatest amounts of rain fell in the storms of the 3d-4th, 13th, and 27-28th. The storm of the 27-28th ended the driest period of the month.

Thunderstorms were most general on the 13th. Reports of damage caused by lightning were widespread, and in the Fayette-Westmoreland area excessive rain caused sudden flooding. Near Melcroft, two children drowned when five houses were swept away. From such widely separated areas as Bucks, Dauphin, Venango, and York Counties reports were received of additional property damage caused by high winds.

The weather during the meteorological summer months of June, July, and August was hot and dry. The average temperature was 72.1°, 1.9° above the 56-year normal, due primarily to the large surplus accumulated in June. It was hotter than any similar period since 1934 and was, with 1892, the 5th warmest summer in the period of record. Precipitation was 2.09 inches below the 56-year normal for the period. This was the driest since 1932 and the 11th lowest average in the period of record. The lack of rain, which was noticeable in some areas in the latter part of June, became more pronounced as the summer progressed and produced drought conditions in the southeast by the end of August. Crops were stunted and dying and fall plowing was practically at a standstill. Increasing numbers of wells and cisterns went dry, and in some localities measures were taken to counteract unsanitary conditions caused by dwindling streams. Farmers were hauling water for livestock and feeding supplemental roughage to cattle.

ERRATA

July, 1943.—Page, 51, Huntingdon, minimum temperatures on the 7th and 8th should be 62° and 64°, respectively.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 78 stations was 70.8°, which is 0.5° above the 56-year normal for August. The highest monthly mean was 79.4° at Marcus Hook, and the lowest was 63.3° at Black Moshannon Airport. Extremes ranged from a maximum of 101° at Phoenixville, on the 24th and 25th to a minimum of 33° at Black Moshannon Airport, on the 20th.

PRECIPITATION.

The average precipitation for the State as deduced from the observations at 201 stations was 2.72 inches, which is 1.48 inches below the 56-year normal for August. The greatest monthly amount was 6.53 inches at Greensburg, and the least, 0.43 inch at West Grove. The greatest amount for any 24 consecutive hours was 3.90 inches at Greensburg on the 13th.

For cooperative stations the departure from normal temperatures are computed from averages of entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 or more years of record are computed from a normal or "standard mean," adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for period of record are used. † On other dates also. § Incomplete. ‖ Total partially estimated. * Estimated. T.(trace) indicates precipitation less than .01 inch.

Reference letters, [a], [b], [c], etc., indicate, respectively, 1, 2, 3, etc., missing from therecord.

Figures and letters following station indicate distance and direction from the city and replace the previous designation 'near'. Locations not appearing here are shown in the Daily Precipitation Table.

‡ Philipsburg is Black Moshannon Airport.

Except as otherwise indicated, observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation. [1] First order Weather Bureau station; precipitation is for 24-hour period, midnight to midnight, unless otherwise indicated. [2] Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. [3] Precipitation for period, midnight to midnight. [4] Precipitation for period, noon to noon. [5] Precipitation for period, 1:30 a. m. of date on which amount is recorded to 1:30 a. m. following date. [6] Observation taken at a fixed hour between sunset and 11:00 p. m. ‡ Precipitation measured with recording gage, midnight to midnight. * Included in next measurement. § Incomplete or missing. † Daily amounts inconsistent. T. (trace), when precipitation is less than .01 inch. ‖ Record partially estimated. ** Boswell was formerly Laurel Hill Summit. §§ Ford City was formerly Crooked Creek Dam. ‖‖ Putneyville was formerly Mahoning Dam.

CLIMATOLOGICAL DATA

L. F. CONOVER

HARRISBURG, PA.

VOL. XLVIII. SEPTEMBER, 1943 No. 9.

GENERAL SUMMARY.

This was the sixth coolest September of record and, excepting 1941, the average temperature for the State was lower than it had been in any September since 1928. It was also the first time since April that the average temperature has been below normal. The small excess accumulated during the preceding eight months was converted into an average daily deficiency of 0.1°. Extreme maxima, recorded at the beginning of the month, were higher than any since June at a number of stations. Middletown's 102°, on the 1st, was the highest reading of the year in Pennsylvania. Minima occurred most generally on the 26th when station records for September minima were broken at several points in the north-central portion. The lowest, 18°, reported by both Black Moshannon Airport and Kane, established a new record for September. In contrast to the hot weather of the first week, which caused a few heat prostrations, most mountain and northern stations had experienced freezing temperatures by the 30th.

The precipitation average was the lowest for any September in the period of record and the lowest for any month since October, 1924. The accumulated deficiency for the year is now 4.33 inches. Periods of precipitation were general but amounts were insignificant until the end of the month. On the 30th, wind blew down trees and interrupted utility services in the Philadelphia area. This storm, continuing on October 1st, produced more precipitation, at most eastern stations, than had fallen in the entire preceding month.

The past growing season was decidedly discouraging. Planting was delayed by a cool, wet spring. Excessive heat in June matured crops rapidly, but deficient rainfall in July, August, and September reduced yield and quality generally. Considerable amounts of late corn and buckwheat in the north part were frost-killed in September. Drought conditions, serious at the end of August, had spread and steadily grown worse. Wells and springs, always dependable in former years, dried up. Hauling water for livestock was a regular chore on many farms, and in some localities water for human consumption was scarce. Pastures were burned and brown and many dairy herds were on full stable feeding. Plowing for and seeding winter grains were increasingly retarded as the ground was too hard and dry for field work, and this work had only started in some of the drought-stricken areas as the month closed. G. W. S.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 80 stations was 61.4°, which is 2.8° below the 56-year normal for September. The highest monthly mean was 68.8° at Marcus Hook, and the lowest was 54.1° at Kane. Extremes ranged from a maximum of 102° at Middletown, on the 1st, to a minimum of 18° at Kane and Black Moshannon Airport, on the 26th.

PRECIPITATION.

The average precipitation for the State as deduced from the observations at 203 stations was 0.72 inch, which is 2.61 inches below the 56-year normal for September. The greatest monthly amount was 3.38 inches at Erie, while the least was 0.04 inch at Newport. The greatest amount for any 24 consecutive hours was 2.54 inches at Wernersville on September 30th and October 1st. A trace of snow fell at Warren on the 26th.

For cooperative stations the departure from normal temperatures are computed from averages of entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 or more years of record are computed from a normal or "standard mean," adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for period of record are used. † On other dates also. § Incomplete. ‖ Total partially estimated. • Estimated. T.(trace) indicates precipitation less than .01 inch. Reference letters, [a], [b], [c], etc., indicate, respectively, 1, 2, 3, etc., missing from the record.

Figures and letters following station indicate distance and direction from the city and replace the previous designation 'near'. Locations not appearing here are shown in the Daily Precipitation Table.

‡ Philipsburg is Black Moshannon Airport.

W. B. O., Philadelphia-11-25-43-975

Except as otherwise indicated, observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation. [1] First order Weather Bureau station: precipitation is for 24-hour period, midnight to midnight, unless otherwise indicated. [2] Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. [3] Precipitation for period, midnight to midnight. [4] Precipitation for period, noon to noon. [5] Precipitation for period, 1:30 a. m. of date on which amount is recorded to 1:30 a. m. following date. [6] Observation taken at a fixed hour between sunset and 11:00 p.m. ‡ Precipitation measured with recording gage, midnight to midnight. * Included in next measurement. § Incomplete or missing. † Daily amounts inconsistent. T. (trace), when precipitation is less than .01 inch. ‖ Record partially estimated. ** Boswell was formerly Laurel Hill Summit. §§ Ford City was formerly Crooked Creek Dam. |||| Putneyville was formerly Mahoning Dam.

CLIMATOLOGICAL DATA

L. F. CONOVER

HARRISBURG, PA.

VOL. XLVIII. OCTOBER, 1943. No. 10.

GENERAL SUMMARY.

The average temperature for the State was again well below normal, and the average daily deficiency, accumulated for the year, increased to 0.3°. Excepting 1940, this was the coolest October since 1925, but the absolute extremes for the month were not approached. Freezing temperatures had been recorded at all but a few stations as the month closed.

Precipitation was considerably above normal, reducing the accumulated deficiency for the year to 1.98 inches. Rain was general on the first two days of the month, greatest amounts falling in the east portion. A period of dry weather followed, but after the 13th, precipitation was reported by all stations on more than 60 per cent of the remaining days. Excessive rainfall was reported in the storm of the 15-16th and, more generally, in the storm of the 25-26th. The first storm produced greatest 24-hour measurements at western stations while eastern stations were most affected by the latter. Light snow was general on the 18th north and west of the mountains. Sleet and hail were reported by scattered stations. Thunderstorms were reported, generally, on the 16th and, at some points, on the 22d.

A small tornado passed over the Lake Wallenpaupack section on the 16th. The track, about eight miles long, was mainly over a wooded area so that comparatively minor damage resulted.

The October rainfall was 61 per cent higher than the total for the two preceding months. The drought was broken. Wells and springs were replenished. Winter grains were materially aided. Pastures were revived in many localities although, with the season so far advanced, they will provide little feed for livestock. In some places, the harvesting of late crops was retarded by too much rain. Forest fires had been kept at a minimum during the early autumn, although they were a constant and growing threat. This threat materialized during the second week, when several hundred persistent fires broke out suddenly. They were brought under control and further danger was eliminated by the drenching rains during the latter part of the month.

G. W. S.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 76 stations was 50.1°, which is 2.5° below the 56-year normal for October. The highest monthly mean was 56.8° at Marcus Hook, and the lowest was 43.8° at Kane. Extremes ranged from a maximum of 89° at Phoenixville, on the 7th, to a minimum of 17° at Black Moshannon Airport, on the 6th.

PRECIPITATION.

The average precipitation for the State as deduced from the observations at 203 stations was 5.63 inches, which is 2.35 inches above the 56-year normal for October. The greatest monthly amount was 10.68 inches at Pine Grove, while the least was 2.15 inches at Lake Lynn. The greatest amount for any 24 consecutive hours was 3.73 inches at New Park on the 25-26th.

The average snowfall for the State was 0.3 inch, which is 0.1 inch above the 56-year normal. The greatest monthly snowfall was 8.2 inches at Erie. The greatest fall for any observational day was 5.3 inches at Erie, on the 17th.

For cooperative stations the departure from normal temperatures are computed from averages of entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 or more years of record are computed from a normal or "standard mean," adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for period of record are used. † On other dates also. § Incomplete. ‖ Total partially estimated. * Estimated. T.(trace) indicates precipitation less than .01 inch. Reference letters, a, b, c, etc., indicate, respectively, 1, 2, 3, etc., missing from the record.

Figures and letters following station indicate distance and direction from the city and replace the previous designation 'near'. Locations not appearing here are shown in the Daily Precipitation Table.

‡ Philipsburg is Black Moshannon Airport.

Except as otherwise indicated, observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation. [1] First order Weather Bureau station; precipitation is for 24-hour period, midnight to midnight, unless otherwise indicated. [2] Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. [3] Precipitation for period, midnight to midnight. [4] Precipitation for period, noon to noon. [5] Precipitation for period, 1:30 a. m. of date on which amount is recorded to 1:30 a. m. following date. [6] Observation taken at a fixed hour between sunset and 11:00 p.m. ‡ Precipitation measured with recording gage, midnight to midnight. * Included in next measurement. § Incomplete or missing. † Daily amounts inconsistent. T. (trace), when precipitation is less than .01 inch. ‖ Record partially estimated. ** Boswell was formerly Laurel Hill Summit. §§ Ford City was formerly Crooked Creek Dam. ‖‖ Putneyville was formerly Mahoning Dam.

HARRISBURG, PA.

VOL. XLVIII. NOVEMBER 1943. No. 11.

GENERAL SUMMARY.

For the third successive month, the average temperature for the State was nearly 3° below normal and the accumulated average daily deficiency for the year was increased to 0.6°. It was the ninth coolest November of record and the coolest since 1936. Only 5 stations, in the extreme south portion, reported averages above their normals. Highest temperatures were recorded on the 1st in the west part and about the 8th elsewhere. Lowest minima occurred at most stations on the 29th, although temperatures as low or lower were reported on the 17th at some stations.

Precipitation was about normal, in amount and in frequency of occurrence. The accumulated deficiency for the year is now 1.97 inches. Most eastern stations reported amounts in excess of their normals, the accumulated surplus being sufficient to counterbalance deficiencies in the west portion. Most of the precipitation occurred in the first half of the month. All stations reported their greatest 24-hour amounts during that period. The storm of the 8th produced most of November's precipitation. At about 80% of the stations reporting, this storm produced the greatest 24-hour measurements of the month. East of a line extending northeastward from Arendtsville to Tunkhannock, the rate of fall was excessive and a number of mountain stations east of the Susquehanna River reported their greatest November 24-hour amounts of record.

Snowfall at northern stations was well above normal, two stations reporting more than a foot of snow. However, the majority reported less than 1.0 inch and most stations in the southern half had no more than a trace.

The rains of October and early November benefited farm lands which had dried out during the prolonged drought of the summer. Toward the close of the month, they were in excellent condition for fall plowing for spring planting but the imminence of freezing weather permitted scant time for this work.

G. W. S.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 78 stations was 38.7°, which is 2.6° below the 56-year normal for November. The highest monthly mean was 46.4° at Marcus Hook, and the lowest was 32.0° at Kane. Extremes ranged from a maximum of 79° at Donora, Lewistown, and Uniontown on the 1st to a minimum of 7° at Black Moshannon Airport on the 29th.

PRECIPITATION.

The average precipitation for the State as deduced from the observations at 201 stations was 2.87 inches, which is 0.01 inch above the 56-year normal for November. The greatest monthly amount was 7.02 inches at Mauch Chunk, while the least was 0.99 inch at the Pittsburgh City Office of the Weather Bureau. The greatest amount recorded in any 24 consecutive hours was 5.10 inches at Gordon on the 8-9th.

The average snowfall for the State was 2.2 inches, which is 0.5 inch below the 56-year normal. The greatest monthly snowfall was 15.3 inches at Bradford. The greatest fall for any observational day was 7.0 inches at Montrose on the 16th.

ERRATA

October, 1943.—Page 71, Lewistown, number of days with precipitation of 0.01 inch or more should be 14; York, total precipitation should be 8.07 inches, departure, +5.03 inches. Page 73, York, precipitation measurement on the 28th should be 1.23 inches; total should be 8.07 inches.

For cooperative stations the departure from normal temperatures are computed from averages of entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 or more years of record are computed from a normal or "standard mean," adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for period of record are used. † On other dates also. § Incomplete. ‖ Total partially estimated. • Estimated. T.(trace) indicates precipitation less than .01 inch. Reference letters, [a], [b], [c], etc., indicate, respectively, 1, 2, 3, etc., missing from the record.

Figures and letters following station indicate distance and direction from the city and replace the previous designation 'near'. Locations not appearing here are shown in the Daily Precipitation Table. ‡ Philipsburg is Black Moshannon Airport.

Daily Precipitation for November 1943

Except as otherwise indicated, observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation. [1] First order Weather Bureau station; precipitation is for 24-hour period, midnight to midnight, unless otherwise indicated. [2] Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. [3] Precipitation for period, midnight to midnight. [4] Precipitation for period, noon to noon. [5] Precipitation for period, 1:30 a. m. of date on which amount is recorded to 1:30 a. m. following date. [6] Observation taken at a fixed hour between sunset and 11:00 p. m. ‡ Precipitation measured with recording gage, midnight to midnight. * Included in next measurement. § Incomplete or missing. † Daily amounts inconsistent. T. (trace), when precipitation is less than .01 inch. ‖ Record partially estimated. ** Boswell was formerly Laurel Hill Summit. §§ Ford City was formerly Crooked Creek Dam. ‖‖ Putneyville was formerly Mahoning Dam.

CLIMATOLOGICAL DATA

L. F. CONOVER

HARRISBURG, PA.

VOL. XLVIII. DECEMBER 1943. No. 12.

GENERAL SUMMARY.

The average temperature was again below normal, resulting in a daily deficiency, for the last four months, of 2.7°. Excepting 1942, this was the coldest December since 1935. Highest temperatures were recorded early in the month. Lowest minima occurred, generally, about the 15th and the extreme, —23°, equalled those of 1920 and 1924 in being the third lowest December temperature of record. One man died of the cold near Latrobe, Westmoreland County, on the 15th.

This was the driest December of record. As a result of the deficiency of 1.96 inches, precipitation, in 1943, was 3.93 inches below normal. December's precipitation was fairly frequent but amounts were very light. The average number of days on which measurable amounts fell was only five, the lowest in the period of record for the month. In the storm of the 26th, which produced about 75% of the total precipitation, rain froze as it fell, building up accumulations of glaze on exposed surfaces. Power lines broke and some damage to trees was reported. Highways were impassable and in the mountain regions, particularly, bus schedules were suspended. This complicated the transportation problems of the railroads, already over-burdened by holiday traffic.

The average snowfall was slightly less than November's and was less than one third normal. Snow occurred on a number of days about mid-December, but significant amounts were confined to northwestern stations.

The ground was frozen during most of the month, diminishing the amount of outside work done on the farms. Stable feeding rapidly depleted supplies of home-grown feed and grains. Combined with the low temperatures, the lack of snow cover was a source of potential damage to winter grains. Wells and springs were dry in some localities and farmers were hauling water for stock. The storm of the 26th was of some benefit but, due to the frozen ground, the soil moisture was not replenished as much as could be desired. G. W. S.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 78 stations was 28.4°, which is 3.0° below the 56-year normal for December. The highest monthly mean was 36.9° at Marcus Hook, and the lowest was 21.0° at Kane. Extremes ranged from a maximum of 63° at Phoenixville on the 9th to a minimum of —23° at Kane on the 15th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 197 stations, was 1.12 inches, which is 1.96 inches below the 56-year normal for December. The greatest monthly amount was 3.23 inches at Laurel Hill Tunnel, while the least was 0.45 inch at Wellsboro. The greatest amount recorded in any 24 consecutive hours was 1.45 inches at Black Moshannon Airport, Philipsburg on the 26-27th.

The average snowfall for the State was 2.1 inches, which is 5.5 inches below the 56-year normal. The greatest monthly snowfall was 13.7 inches at Meadville. The greatest fall for any observational day was 5.0 inches at Titusville on the 22d.

ERRATA

October, 1943.—Page 70, table of comparative data for October, number of cloudy days in 1943 should be 15. Page 71, State mean of number of cloudy days should be 15.

November, 1943.—Page 79, Gordon, total precipitation should be 5.92 inches, departure, +2.74 inches; Lawrenceville, total precipitation should be 2.01 inches, departure, —0.26 inch. Page 80, Fredericksville, total precipitation should be 3.64 inches; Lawrenceville, total precipitation should be 2.01 inches. Page 81, East Waterford, total precipitation should be 3.01 inches; Gordon, total precipitation should be 5.92 inches.

For cooperative stations the departure from normal temperatures are computed from averages of entire period for stations having 10 or more years of record. Departures of precipitation for stations with 15 or more years of record are computed from a normal or "standard mean," adjusted to a uniform 35-year period; for stations of 10 to 14 years the means for period of record are used. † On other dates also. § Incomplete. ‖ Total partially estimated. • Estimated. T.(trace) indicates precipitation less than .01 inch. Reference letters, [a], [b], [c], etc., indicate, respectively, 1, 2, 3, etc., missing from the record.

Figures and letters following station indicate distance and direction from the city and replace the previous designation 'near'. Locations not appearing here are shown in the Daily Precipitation Table. ‡ Philipsburg is Black Moshannon Airport.

Except as otherwise indicated, observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation. [1] First order Weather Bureau station; precipitation is for 24-hour period, midnight to midnight, unless otherwise indicated. [2] Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. [3] Precipitation for period, midnight to midnight. [4] Precipitation for period, noon to noon. [5] Precipitation for period, 1:30 a. m. of date on which amount is recorded to 1:30 a. m. following date. [6] Observation taken at a fixed hour between sunset and 11:00 p.m. ‡ Precipitation measured with recording gage, midnight to midnight. * Included in next measurement. § Incomplete or missing. † Daily amounts inconsistent. T. (trace), when precipitation is less than .01 inch. ‖ Record partially estimated. ** Boswell was formerly Laurel Hill Summit. §§ Ford City was formerly Crooked Creek Dam. ‖‖ Putneyville was formerly Mahoning Dam.

CLIMATOLOGICAL DATA

32 PENNSYLVANIA SECTION,
L. F. CONOVER.
HARRISBURG, PA.

VOL. XLVII. ANNUAL SUMMARY, 1943. No. 13.

GENERAL SUMMARY.

Contrasting variations from the coldest April to the warmest June of record; from an unusually wet May and October to the driest September and December of record, made 1943 an interesting weather year, although at the close of the year, the meteorological ledger was nearly balanced. The mean annual temperature of 49.5° was 0.7° below the average and the total precipitation of 38.04 inches was 3.99 inches below normal. These are not significant departures in Pennsylvania's 56-year climatological history.

The most important single feature during the year was the drought condition that developed in the eastern portion of the State. Vegetation and agricultural operations, impeded during a cold, wet spring, were further hindered by a hot, dry summer. A drought was fully developed in the south-central counties by mid-August and it spread north and eastward during September, the driest month since October, 1924. Precipitation deficiencies accumulated during the growing season, reached four to eight inches in central and eastern counties while excesses accumulated in some western counties, reaching 7.56 inches at Claysville and 5.39 inches at Warren. Wells and springs, normally dependable, were dry and water was hauled for livestock and, in some localities, for human consumption. One of the wettest Octobers of record in Eastern Pennsylvania relieved the drought but came too late to be helpful to the the season's crops. Largely as a result of the unfavorable weather, crop production was 8% less than 1942 despite increased acreage and efforts.

WEATHER BY MONTHS

JANUARY.—Snowfall was 50% above normal. The extremely cold second week and unusually warm third week experienced in neighboring states did not affect Pennsylvania, and temperatures were about normal. Freezing rain produced unusually large accumulations of glaze in Wayne County on the 18-19th. Wind damage occurred in south-central counties on the 19th.

FEBRUARY.—A rather mild and dry month. Excepting in the mountains, the snow cover was inadequate. Although streams rose at the end of the month and four children were drowned in swollen currents, rivers crested well below flood stages.

MARCH.—Late winter conditions prevailed the first half. However, the latter half was mild and dry. Generally, winter grains which had inadequate snow protection during the winter suffered further damage from alternate freezing and thawing. Fruit trees suffered some freeze injury.

APRIL.—This was the coldest April of record and resembled a warm, windy March, rather than the second month of spring. Abnormal precipitation combined with the cold to further restrict outdoor work and vegetal growth. Local flooding occurred in the Bradford area on the 27th.

MAY.—Although temperatures were more seasonable, the precipitation was again abnormal, the fourth highest total of record. At the close of the month little corn, oats or potatoes were planted in the northern portion of the State and the crop season was now very late. Flood damage occurred in Lackawanna County on the 18th and Elk County on the 25th. Lightning killed three men and accidents, during other storms, caused four additional deaths.

JUNE.—This was a month of extreme and violent weather. It was the hottest June of record and the hottest month of the year. Seventeen deaths were attributed to the heat from the 1st to 26th and twenty-six about the 27th. Thunderstorms occurred about one out of every two days but precipitation averaged the lowest since 1933. Soil erosion, flooding, and hail beset local areas while in south-central counties precipitation was deficient. The month, as a whole, was favorable to crops.

JULY.—Killing frosts at a few mountain localities and record low temperatures at scattered stations on the first proved a marked and pleasant reaction to the closing week of June. However, the weather for the month was nearly as warm and violent as that of the previous one. While eastern counties experienced subnormal rainfall, southwestern counties received unusual amounts. Claysville's monthly and greatest 24-hour precipitation records were exceeded. Flash floods resulted from local storms on the 7th, 12th, and 27th; lightning killed two boys at Butler on the 14th and a man at Clearfield on the 27th; hail stones, the size of baseballs, were reported at Phoenixville on the 20th. Small tornadoes were reported at Oil City and Pleasantville on the 29th. In Oil City, two persons were injured and property damage was estimated at $45,000. Property damage over the State amounted to more than a million dollars.

AUGUST.—While drought conditions were spreading from a center in Adams and York counties, due to the third warm, dry month, excessive rain in Fayette and Westmoreland counties again caused sudden flooding. On the 13th, two children were drowned, as five houses near Melcroft were swept from their foundations. Summer rainfall deficiencies reached 7.25 inches at Gettysburg, 4.98 inches at Freeland, 5.92 inches at West Grove, and 4.37 inches at Somerset, in marked contrast to an excess of 1.10 inches at Derry and 1.66 at Coudersport; the daily temperatures averaged about 2° warmer than the mean.

SEPTEMBER.—Rainfall was 25% less than any previous September and only 19% of normal. It was one of the six coolest. Several heat prostrations were reported at the beginning of the month when the highest temperature of the year, 102°, was reported at Middletown. More rain fell at eastern stations on the 30th than had been reported in the previous month. A new low temperature of 18° for the State was recorded at Black Moshannon Airport on the 26th.

OCTOBER.—Drought conditions were relieved by one of the wettest Octobers of record in Eastern Pennsylvania, where rainfall was more than twice the usual amount. The State average was 61% greater than the August-September total. Excessive rainfall, at western stations on the 15-16th and at eastern stations on the 25-26th, overcame a serious forest fire hazard. Wells and springs were replenished, pastures were revived, fall seedings and winter grains benefited, but in some localities where the farmers had been harassed by soil too hard to cultivate, they found it now too wet. A small tornado passed over Lake Wallenpaupack on the 16th with very little damage resulting.

NOVEMBER.—This being the third consecutive month with a subnormal temperature, the autumn season closed with the temperature 2.6° below the normal. The first half of the month continued the rainy pattern of October and, as a consequence, autumn's rainfall was only 0.25 inch below the average, despite

(Continued on page 99).

ERRATA

Departures as shown on the various tables incorporate all corrections to 1943 monthly issues of Pennsylvania Climatological Data.

September, 1943, precipitation average for period of record should be 3.39, inches departure in 1943 should be −2.67 inches.

December, 1943, page 86, Martinsburg, monthly mean temperature should be 27.9°.

December, 1943, page 91, Martinsburg, mean maximum should be 35.8°.

WEATHER BY MONTHS (Continued from front page).

September's great deficiency. The storm of the 8th, at many eastern stations, produced greatest 24-hour precipitation records for the month. The State missed a heavy snowfall at the end of the month, experienced in southeastern New York; the State average, though, was not much under normal.

DECEMBER.—Characteristic of this year of sharp reversals, this month, like September, was the driest of record. About 75% of the month's precipitation occurred on the 26th when freezing rain complicated transportation facilities, overburdened with holiday traffic. It was a cold month but snow was conspicuously absent and bare ground presented a source of potential damage to winter grains; well levels were falling and frozen soil prevented much outside work.

CLIMATOLOGICAL DATA

PENNSYLVANIA SECTION.

L. F. CONOVER

HARRISBURG, PA.

VOL. XLIX. JANUARY 1944. No. 1.

GENERAL SUMMARY.

This was the warmest January since 1937 and the first month since last August in which the average temperature was above normal. Lowest temperatures were recorded at most stations about the 9th, at the beginning of a dry, pleasant fortnight, when persistent high pressure dominated Pennsylvania. The warmest period of the month occurred between the 24th and 29th when a high pressure system became stationary over the Carolinas, permitting the inflow of very warm air over the State. The effect was most noticeable on the 25th and 26th.

During the first week of the month, a storm moved northeastward off the Delaware Coast and, a few days later, another moved up the St. Lawrence Valley. These storms produced heavy precipitation but the month's total was well below normal due to the light amounts received thereafter. The coastal storm of the 3d produced the greatest 24-hour amounts of the month and rather heavy falls of snow centered in southern-mountain counties. Sleet and freezing rain were reported, with glaze of considerable proportion being built up on exposed surfaces in some localities. Road conditions were bad and many power interruptions were reported. Numerous traffic accidents occurred, resulting in two deaths in the Pittsburgh area. Snowfall was below normal, stations in the southern mountains reporting the greatest amounts. As a result of the light amounts and the high temperatures, snow protection was lacking during most of the month except in northern localities. Heavy fog was reported frequently during the latter half of the month and was most general on the 27th and 28th.

The water shortage has not damaged crops to any extent but it is causing some inconvenience, as farmers in many localities are compelled to haul water for livestock. Farm work has advanced considerably due to the open winter, although the handicap of the dry fall, which made plowing impossible, will be difficult to overcome. Freezing temperatures have damaged winter grains. Reports of roads as dusty as in summer have been an unusual feature of the month.

G. W. S.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 87 stations was 30.6°, which is 2.2° above the 57-year normal for January. The highest monthly mean was 37.4° at Marcus Hook, and the lowest was 25.3° at Kane. Extremes ranged from a maximum of 68° at York on the 26th to a minimum of −12° at Coudersport, Somerset, and Springs on the 9th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 201 stations, was 2.12 inches, which is 1.04 inches below the 57-year normal for January. The greatest monthly amount was 4.29 inches at South Mountain, while the least was 0.35 inch at Centerville. The greatest amount recorded in any 24 consecutive hours was 3.08 inches at McConnellsburg on the 2-3d.

The average snowfall for the State was 4.3 inches, which is 6.1 inches below the 57-year normal. The greatest monthly snowfall was 18.7 inches at Springs. The greatest fall for any observational day was 13.0 inches at Springs on the 3d.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. †† Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[1] Midnight to midnight.
[2] Measured in the morning for the preceding 24 hours.
[3] Data for 24 hours ending at 1:30 a. m. of the following day.
[4] Best available used for stations not equipped with recorders.
[5] Recording gage.
[6] At a fixed hour between sunset and 11:00 p. m.
[7] Noon to noon.

List of Changes in Station Designations

For more exact location of the equipment, station names have been changed as follows:

Boswell	formerly	Laurel Hill Summit
Dauphin	"	Peters Mountain Tower
Ford City	"	Crooked Creek Dam
Grantville	"	Manada Gap
Jamestown	"	Pymatuning Dam
Kregar	"	Laurel Hill Tunnel
McConnellstown	"	Loop Mountain Tower
Milroy	"	Penn Nursery
Monroeton	"	Kellogg Mountain Tower
Neffs Mill	"	Charter Oak
Newburg	"	Blue Mountain Interchange
Putneyville	"	Mahoning Dam
Sheffield	"	Cherry Grove
Williamsport 4 SE	"	Shaffers Path

Daily Temperatures for January 1944

VOL. XLIX. FEBRUARY 1944. No. 2.

GENERAL SUMMARY.

The mild open weather of January was continued, to a lesser degree, in February. The accumulated average daily surplus for these two months is 1.6°. Temperatures were mild early in the month but fell sharply during the second decade when lowest readings were general and a shortage of fuel confronted homes and businesses. This condition was alleviated during the last week as temperatures averaged well above normal and highest maxima of the month occurred.

Precipitation was deficient, mainly as the result of the unusual movement of pressure systems. Travelling rapidly, their paths lay to the north or south so that the State did not feel the full effect of the storms. In spite of the deficiency, frequency of occurrence was about normal. The accumulated deficiency for the year is now 1.85 inches. Snowfall was about normal, but more than double the amount received in January. The snow, frequently accompanied by sleet and freezing rain, created dangerous road conditions. Cindering crews were kept busy and utilities encountered some difficulty in maintaining their services. The worst storm was that of the 11-12th when a man died in Philadelphia as a result of a fall on the slippery streets.

Thunderstorms were reported on the 22d at northern stations and on the 27th at southern stations. The former were more general. Wind damaged property in Pittsburgh on the 22d. A meteor was seen by a resident of Hanover in the early hours of the 24th.

The past winter was the driest of record with an average of 5.24 inches. The previous record was 5.26 inches, established in 1901. December's temperature deficiency was overcome and the average for the period was normal. Snowfall during December was only 13% of the season's 15.8 inches. As a result of this and the higher temperatures prevalent in January and February, the snow cover was inadequate throughout the period. Winter grains and new seedings suffered and the condition of winter wheat and rye is reported the poorest in the last eight years, although the root system is generally good. Farm work was well advanced as the month closed. G. W. S.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 87 stations was 29.4°, which is 1.0° above the 57-year normal for February. The highest monthly mean was 37.2° at Marcus Hook, and the lowest was 21.2° at Kane. Extremes ranged from a maximum of 67° at Phoenixville on the 24th and at Uniontown on the 27th to a minimum of −18° at Bradford and Kane on the 19th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 197 stations, was 2.00 inches, which is 0.81 inch below the 57-year normal for February. The greatest monthly amount was 4.18 inches at Springs, while the least was 0.90 inch at Milroy. The greatest amount recorded in any 24 consecutive hours was 1.72 inches at Meadville on the 22-23d.

The average snowfall for the State was 9.4 inches, which is 1.3 inches below the 57-year normal. The greatest monthly snowfall was 24.5 inches at Johnstown. The greatest fall for any observational day was 9.3 inches at Rush on the 11-12th.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. ‡‡ Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Wind-shield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[1] Midnight to midnight.
[2] Measured in the morning for the preceding 24 hours.
[3] Data for 24 hours ending at 1:30 a. m. of the following day.
[4] Best available used for stations not equipped with recorders.
[5] Recording gage.
[6] At a fixed hour between sunset and 11:00 p. m.
[7] Noon to noon.

List of Changes in Station Designations

For more exact location of the equipment, station names have been changed as follows:

Boswell	formerly	Laurel Hill Summit
Dauphin	"	Peters Mountain Tower
Ford City	"	Crooked Creek Dam
Grantville	"	Manada Gap
Jamestown	"	Pymatuning Dam
Kregar	"	Laurel Hill Tunnel
McConnellstown	"	Loop Mountain Tower
Milroy	"	Penn Nursery
Monroeton	"	Kellogg Mountain Tower
Neffs Mill	"	Charter Oak
Newburg	"	Blue Mountain Interchange
Putneyville	"	Mahoning Dam
Sheffield	"	Cherry Grove
Williamsport 4 SE	"	Shaffers Path

Daily Temperatures for February 1944

HARRISBURG, PA.

VOL. XLIX. MARCH 1944. No. 3.

GENERAL SUMMARY.

March was cold and stormy, reversing the trend of the two preceding months and giving the State another month of winter weather. Temperatures were consistently below normal and the consequent deficiency eliminated the average daily surplus which had accumulated during January and February.

Precipitation was above normal in frequency of occurrence and in amount. The average was higher than in any month since last October and exceeded the combined averages of the first two months of the year, reducing the deficiency accumulated since January 1st to 0.85 inch. Snow, sleet, and freezing rain contributed to the excess, the most significant amounts falling on the 4th and the 19th-20th. These were the most damaging storms of the month and eight deaths were attributed, directly or indirectly, to the dangerous conditions created by snow-covered, slippery roads. Of these deaths, seven occurred on the 4th and one on the 19th. Chiefly as a result of these storms, the average snowfall was greater than in any month since January, 1943 and was 43 percent of the season's total.

The frequent storms raised stream levels and all sections reported minor flooding at some time during the month but crests were well below flood stages. In Wayne County, two small temporary bridges were damaged by ice jams on the 13th. Thunderstorms, reported by most stations, were most general on the 16th and 27th. The most damaging one occurred on the 27th, when lightning struck a powder mill. The resulting explosion shattered 100 windows in Uniontown, 6 miles distant.

High winds were general on the 29th. Damage to property and trees was extensive, particularly in southwestern counties and at Erie. At the latter place, a velocity of 65 miles per hour was reported. Two people were injured and one man was killed by flying debris.

Weather conditions were generally favorable for crops during March and the condition of the soil was improved greatly by the month's adequate precipitation. Winter wheat prospects were brighter than on March 1st and it appears that any shortage due to decreased yield will be more than made up by increased acreage. The outlook for fruits is promising. G. W. S.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 82 stations was 34.4°, which is 3.1° below the 57-year normal for March. The highest monthly mean was 41.4° at Marcus Hook, and the lowest was 26.0° at Montrose. Extremes ranged from a maximum of 79° at Donora on the 15th to a minimum of −6° at Kane on the 10th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 199 stations, was 4.69 inches, which is 1.17 inches above the 57-year normal for March. The greatest monthly amount was 8.44 inches at Johnstown, while the least was 1.87 inches at Union City. The greatest amount recorded in any 24 consecutive hours was 2.05 inches at George School on the 12-13th.

The average snowfall for the State was 11.8 inches, which is 3.9 inches above the 57-year normal. The greatest monthly snowfall was 27.0 inches at Boswell. The greatest fall for any observational day was 13.4 inches at Johnstown on the 5th.

ERRATA

February, 1944. Page 10, Chambersburg, total precipitation should be 1.40 inches, departure, −1.36 inches; Freeland, mean temperature should be 25.8°, departure, +1.1°. Page 12, Chambersburg, total precipitation should be 1.40 inches. Page 14, Chambersburg, minimum on 26th should be 32°. Page 15, Lancaster, mean maximum should be 42.6°.

OBITUARIES

Mrs. Lillian F. Becker, cooperative observer at Lakeville, Pennsylvania, died on March 15, 1944. Her services began in January, 1928 and continued until the time of her death.

Dr. Benjamin L. Miller, who had been closely connected with the cooperative station at Bethlehem, Pennsylvania, since November 1925, died on March 23, 1944. He had been influential in arranging for the establishment of the cooperative station at Lehigh University.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. ‡‡ Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[1] Midnight to midnight.
[2] Measured in the morning for the preceding 24 hours.
[3] Data for 24 hours ending at 1:30 a. m. of the following day.
[4] Best available used for stations not equipped with recorders.
[5] Recording gage.
[6] At a fixed hour between sunset and 11:00 p. m.
[7] Noon to noon.

List of Changes in Station Designations

For more exact location of the equipment, station names have been changed as follows:

Boswell	formerly	Laurel Hill Summit
Dauphin	"	Peters Mountain Tower
Ford City	"	Crooked Creek Dam
Grantville	"	Manada Gap
Jamestown	"	Pymatuning Dam
Kregar	"	Laurel Hill Tunnel
McConnellstown	"	Loop Mountain Tower
Milroy	"	Penn Nursery
Monroeton	"	Kellogg Mountain Tower
Neffs Mill	"	Charter Oak
Newburg	"	Blue Mountain Interchange
Putneyville	"	Mahoning Dam
Sheffield	"	Cherry Grove
Williamsport 4 SE	"	Shaffers Path

Daily Temperatures for March 1944

HARRISBURG, PA.

VOL. XLIX. APRIL 1944. No. 4.

GENERAL SUMMARY.

Unseasonably cool and rainy weather continued in April. Temperatures were below normal most of the time and only a few days were warm enough to indicate that this was a spring month. Highest maxima were general on the 30th and the extreme equalled the 81° recorded at Gettysburg in April, 1918; the lowest extreme maximum for the period of record for the month. The average daily deficiency accumulated since January 1st is now 0.8°.

Precipitation was frequent and amounts significant; the resulting surplus reduced the year's accumulated deficiency to 0.06 inch. The ground condition was much better than in 1943 when, by the end of April, precipitation was 1.82 inches below the average for the first four months. The average number of days on which measurable amounts were reported was 16, equalling the record for April which was established in 1920. All areas received excesses, those in the east portion being greater. Snow was frequent early in the month, greatest amounts falling on the 4-5th. Sleet fell on the 11th, mostly at northern stations. Thunderstorms were frequent, those of the 23d-24th being most general. During this storm, hail fell at scattered stations.

Minor flooding occurred in the west portion about the 13th, when roads in the vicinity of Meadville were inundated for a short time. Continuous rains, toward the end of the period, raised stream levels in the east, but crests were generally well below flood stages.

Scanty foliage on underbrush and small trees prevented adequate retention of moisture. This condition contributed to the forest fires which were frequent throughout the month. Most stubborn and widespread were those which sprang up during the rainless periods from the 18th to the 20th and from the 28th on.

Conditions continued unfavorable to agriculture. Increasing temperature deficiencies and above-normal precipitation have combined to retard vegetation and field work. Plowing and planting have reached 60% of the stage attained by April 30, 1943. Scarcely anything has been planted in the northern part of the State. Winter grains are showing improvement but growth is not so far advanced as is to be expected at this season. Prospects for fruits of all kinds are promising. G. W. S.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 80 stations was 45.5°, which is 3.1° below the 57-year normal for April. The highest monthly mean was 52.4° at Marcus Hook, and the lowest was 38.8° at Kane. Extremes ranged from a maximum of 81° at Emporium, Lewistown, Lock Haven, Marcus Hook, Sharon, and Williamsport on the 30th to a minimum of 6° at Wellsboro on the 6th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 197 stations, was 4.06 inches, which is 0.62 inch above the 57-year normal for April. The greatest monthly amount was 6.52 inches at Kregar, while the least was 2.24 inches at Ansonia. The greatest amount recorded in any 24 consecutive hours was 2.20 inches at Pennline on the 12th.

The average snowfall for the State was 2.5 inches, which is 0.3 inch above the 57-year normal. The greatest monthly snowfall was 10.9 inches at Meadville. The greatest fall for any observational day was 9.0 inches at New Tripoli on the 5th.

ERRATA

March, 1944. Page 23, Lancaster, mean maximum should be 49.7°; Philadelphia Shawmont, mean minimum should be 29.4°; Port Clinton, mean minimum should be 24.3. Page 24, Pressure, Wind, Humidity, and Sunshine Table, percentage of possible sunshine at Pittsburgh should be 47.

OBITUARY

Mr. Ira J. Keath, cooperative observer at Ephrata, died suddenly on April 12, 1944. His services began in July, 1925 and continued until the time of his death, a period of nearly 20 years of faithful public service.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. ‡‡ Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[1] Midnight to midnight.
[2] Measured in the morning for the preceding 24 hours.
[3] Data for 24 hours ending at 1:30 a. m. of the following day.
[4] Best available used for stations not equipped with recorders.
[5] Recording gage.
[6] At a fixed hour between sunset and 11:00 p. m.
[7] Noon to noon.

List of Changes in Station Designations

For more exact location of the equipment, station names have been changed as follows:

Boswell	formerly	Laurel Hill Summit
Dauphin	"	Peters Mountain Tower
Ford City	"	Crooked Creek Dam
Grantville	"	Manada Gap
Jamestown	"	Pymatuning Dam
Kregar	"	Laurel Hill Tunnel
McConnellstown	"	Loop Mountain Tower
Milroy	"	Penn Nursery
Monroeton	"	Kellogg Mountain Tower
Neffs Mill	"	Charter Oak
Newburg	"	Blue Mountain Interchange
Putneyville	"	Mahoning Dam
Sheffield	"	Cherry Grove
Williamsport 4 SE	"	Shaffers Path

Daily Temperatures for April 1944

HARRISBURG, PA.

VOL. XLIX. MAY 1944. No. 5.

GENERAL SUMMARY.

This was the warmest May in the period of record. The average temperature, 65.6°, exceeded by 0.2° the previous high mark which was established in 1896. At Harrisburg, Reading, Scranton, and State College, it was the warmest May of 44 to 58 years of record but in the longer records available at Erie, Philadelphia, and Pittsburgh, it was the second or third warmest. The deficiency of the two preceding months was overcome and the average spring temperature was about normal. The average daily deficiency accumulated through the first four months was wiped out and there is now an average daily excess of 0.6° for the year.

Precipitation was above normal for the third month and a surplus of 0.33 inch has been accumulated since January 1, in contrast to the deficiency of 1.85 inches reported at the beginning of March. Only a few areas, the largest of which was in the east and southeast, had deficient precipitation in May. Greatest surpluses were reported in the central portion. Heavy rain occurred on a number of days. The storm of the 6-7th produced greatest 24-hour measurements at most stations and amounts were excessive in the Susquehanna Valley, within a rather narrow belt extending from Harrisburg to Montrose. Two women drowned in the Youghiogheny River, near Pittsburgh, when a skiff sank during a severe rainstorm on the 24th. Repeated storms caused a landslide, on the 23d near Oil City, which buried 200 yards of highway under 5 feet of earth and rocks. Minor flooding occurred in all sections at some period during the month. The greatest damage occurred in the Claysville area on the 20th when 1.85 inches fell in an hour.

Thunderstorms occurred with unusual frequency and were reported on all but 5 days. They were most widespread on the 13th, 23d, and 27th. Three people suffered shock when struck by lightning, two at Loysville on the 16th and one at Harrisburg on the 23d. Property damage, caused by wind and lightning, was general throughout the month. Hail was most general in the storms of the 7th, 13th, and 27th.

Forest fires, prevalent at the close of April, continued until the heavy rain of the 6-7th. Subsequent rains, absorbed by the forests, resulted in a steady decline in the number of fires until complete control was established by the 19th. Fires were fewer and damage less than in former years due to the wet spring. This condition counterbalanced the shortage of experienced fire fighters.

Weather during the past spring has presented many obstacles to agriculture. March and April, which were consistently cool and wet, gave way to an extremely warm May, which was more favorable for plant growth, but the continued wet weather further delayed planting and favored the growth of weeds. Heavy showers eroded fields, caused some lodging of winter grains, interfered with spraying, and damaged fruit blossoms. Despite these handicaps, much larger crops of wheat, oats, and fruits are in prospect, as compared with those harvested last year.

G. W. S.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 82 stations was 65.6°, which is 5.8° above the 57-year normal for May. The highest monthly mean was 70.8° at Marcus Hook, and the lowest was 60.0° at Mt. Pocono. Extremes ranged from a maximum of 95° at Sharon on the 31st to a minimum of 27° at Ridgway on the 1st.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 201 stations, was 4.28 inches, which is 0.39 inch above the 57-year normal for May. The greatest monthly amount was 11.03 inches at Kregar, while the least was 1.18 inches at Quakertown. The greatest amount recorded in any 24 consecutive hours was 4.36 inches at Sunbury on the 6-7th.

The only snow reported was a trace at Kane on the 19th.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. ‡‡ Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

1 Midnight to midnight.
2 Measured in the morning for the preceding 24 hours.
3 Data for 24 hours ending at 1:30 a. m. of the following day.
4 Best available used for stations not equipped with recorders.
5 Recording gage.
6 At a fixed hour between sunset and 11:00 p. m.
7 Noon to noon.

VOL. XLIX. JUNE 1944. No. 6.

THE TORNADOES OF JUNE 23, 1944

The most destructive system of tornadoes in the contemporary meteorological history of Pennsylvania occurred over the southwestern counties in the early evening of Friday, June 23, 1944. Loss of life was greater in this catastrophe than from all tornadoes of the previous 70 years in the State.

Nature's most violent manifestation of cyclonic winds—the tornado—is not uncommon to Pennsylvania. At least one twister, in relatively mild form, can be expected to touch some small section of the State each year. The intensity of the 1944 action is without equal in the State and phenomenal in that it persisted in its activity over the rugged terrain covered by its several paths. The nearest approach was that on August 19, 1890 when 16 lives were lost as a tornado passed through Wilkes-Barre.

Conditions favorable for tornadic action developed in the vicinity of the Ohio, West Virginia, and Pennsylvania line during the afternoon of the 23d. A low pressure area was centered over central Michigan at 7:30 a. m., E. S. T., attended by a weak frontal system extending to the southwest from the low center to Milwaukee, Wis. to Davenport, Ia. During the next 12 hours the cold front became more active, especially in its middle section, and moved rapidly eastward, reaching Erie and Mercer, Pa., and Cambridge, O., by 7:30 p. m., E. S. T. This movement across central and northern Ohio was at a rate of nearly 50 miles per hour. By this time, thunderstorms existed along the front with parasitic tornadoes appearing in advance of them. The front continued eastward at this rapid rate until the higher portions of the Allegheny Mountains were reached when its speed dropped to approximately 25 miles per hour and the tornadic action subsided.

The first tornado to affect Pennsylvania originated between 5:30 and 6:00 p. m., E. S. T., in the vicinity of Wellsburg, W. Va. Thence it traveled southeastward to Cumberland Md., a distance of 80 miles, 56 of which were in Pennsylvania. It crossed the State line just east of Wellsburg, W. Va. in Independence Township, Washington County, at a reported time of 6:01 p. m., E. S. T., killing two persons as dwellings and barns were demolished in its path. Two more were killed in Donegal Township, just north of Claysville, before wiping out Camp Buffalo, the summer Y. M. C. A. camp near Taylorstown. The quick thinking of the camp leader saved the lives of 70 young people when he led them from the dining hall to lie in the shelter of a knoll. A horse was carried from a barn north of Claysville and deposited 250 yards away, in the cellar of a house that had been blown away. A letter written by a camper on Buffalo Creek was carried a distance of 100 miles to Grantsville, Md., from which point it was mailed to the address. Entering Greene County at Dividing Ridge, the tornado cleared every building in its path, killed three people at Castile, destroyed the old brick Mt. Zion church and unroofed all but one dwelling in the settlement. The Emerald Coal and Coke Company's mining village of Chartiers, a mile east of Clarksville, consisting of 41 homes and a company store, was completely destroyed and ten persons killed about 7:00 p. m., E. S. T. The company superintendent driving home from the store saw the funnel cloud approaching, got out of his automobile just before it was demolished and blown some distance away. His wife, who took refuge in a cupboard at their home, was found to be alive although the residence was destroyed. Eight more lives were lost at Dry Tavern and in the vicinity of Rices' Landing. At Uniontown debris was noted falling from the sky 35 minutes before the tornado passed to the south. The path of destruction extended to some distance east of Cheat Haven where it passed over the State line about 7:30 p. m., E. S. T., heading toward West Virginia and Maryland.

It is probable that tornadic action developed in Ohio to a small degree an hour or so earlier than at Wellsburg, W. Va., as an investigation by members of the Weather Bureau Office at Pittsburgh indicates evidence of a "major path that extends from Ravenna, O., to the vicinity of Cumberland, Md. However, destruction along this path is only at widely separated points, with the major damage first noted just below Pittsburgh in Baldwin Township." Seventeen fatalities occurred in the McKeesport area of Dravosburg, Port Vue, Versailles, "Avondale Plan" of Boston and Greenock between 6:30 and 6:45 p. m., E. S. T. Twenty-five freight cars were picked up bodily and tossed aside in the Port Vue area. Fortunately, only a portion of the 10th Ward of densely populated McKeesport was affected. As the funnel cloud passed over the Youghiogheny River near Boston, the river was temporarily dried at that point, the mud removed from the river bed and deposited to the east over the "Avondale Plan" of Boston. The path continued fairly well marked along Four Mile Run, the Pennsylvania Turnpike near Donegal, and southwest of Stahlstown to Somerset. Three miles southwest of Stahlstown, members of a family were hurled out of a house while the father was carried 150 to 200 feet with the house. The house was demolished but the man was only bruised.

The course of the third tornado, beginning about 6:08 p. m., E. S. T., extended from Rural Valley, Armstrong County to Twin Rocks, Cambria County. Property damage was extensive in the communities of Rural Valley, Five Points, and Willets. Between Clymer and Indiana, a young mother and child were killed but few persons were injured due to the open country in this area.

The tornadoes had all of their normal characteristics and effects. There was continuous terrific noise, the explosive effect of extremely low pressure, lightning and thunder, although attending rain was comparatively light and little hail was reported. Funnel clouds were not observed over the entire paths but, at some points, several were noted at one time. Those observed "varied in diameter, at the base, from 10 to 100 feet; at the top from 1/2 to 2 miles. Several observers state that the funnel clouds would become detached and would disintegrate as they progressed forward along the path. They had the usual appearance of an elephant's trunk that tended to dip to the ground at intervals and at some points, resembling wobbling tops. The ruggedness of the terrain seemed to have little effect on the course of the funnels in that they tended to move in a straight line but making a path of destruction from 500 to 1,000 feet in width with evidence of damage for one to two miles on either side. Observers who viewed the paths from the air state that there was some meandering but their general direction was from the northwest to southeast and the path looked as though a huge roller had flattened everything in its path."

It is providential that these three paths traversed rather sparcely populated areas. Despite this, loss of life was heavy, property damage extensive. There were 44 deaths, 212 seriously injured, and more than 200 persons with minor injuries; some 200 homes totally destroyed and 500 with major damage. Losses of live stock, barns and stores, and general structures have not been tabulated at the present time. Preliminary estimates place the overall damage in the neighborhood of $2,000,000.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 84 stations was 69.3°, which is 1.1° above the 57 year normal for June. The highest monthly mean was 77.2° at Sharon, and the lowest was 62.8° at Eagles Mere. Extremes ranged from a maximum of 100° at Sharon on the 18th and 19th to a minimum of 29° at Kane and Philipsburg on the 8th.

PRECIPITATION.

The average precipitation for the State as deduced from the observations at 203 stations was 4.53 inches, which is 0.40 inch above the 57-year normal for June. The greatest monthly amount was 8.20 inches at Freeland, while the least was 1.10 inches at Mercer. The greatest amount recorded in any 24 consecutive hours was 3.06 inches at Cedar Run on the 18-19th.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. ‡‡ Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

1 Midnight to midnight.
2 Measured in the morning for the preceding 24 hours.
3 Data for 24 hours ending at 1:30 a. m. of the following day.
4 Best available used for stations not equipped with recorders.
5 Recording gage.
6 At a fixed hour between sunset and 11:00 p. m.
7 Noon to noon.

List of Changes in Station Designations

For more exact location of the equipment, station names have been changed as follows:

Dauphin	formerly	Peters Mountain Tower
Ford City	"	Crooked Creek Dam
Grantville	"	Manada Gap
Jamestown	"	Pymatuning Dam
Kregar	"	Laurel Hill Tunnel
McConnellstown	"	Loop Mountain Tower
Milroy	"	Penn Nursery
Monroeton	"	Kellogg Mountain Tower
Neffs Mill	"	Charter Oak
Newburg	"	Blue Mountain Interchange
Putneyville	"	Mahoning Dam
Sheffield	"	Cherry Grove
Williamsport 4 SE	"	Shaffers Path

CLIMATOLOGICAL DATA

L. F. CONOVER

HARRISBURG, PA.

VOL. XLIX. JULY 1944. No. 7.

GENERAL SUMMARY.

The drought, which was developing at southeastern and west-central stations at the close of June, intensified and spread during July. The continued absence of significant rain was caused by the westward development of the South Atlantic High, blocking off the normal northward flow of moisture.

Accentuating the lack of sufficient rain were many hot, sunny days. Most stations in the southeast reported 15 or more days with maxima of 90° or higher. However, the lack of normal moisture and the clear skies favored radiation and nighttime temperatures were refreshingly cool. About 60% of the stations reported monthly means somewhat above normal but the State average was exactly equal to the 57-year mean and the average daily excess, accumulated since January 1, is now 0.6°. This is 0.2° above the accumulation for 1943, when June and July averaged 2° warmer than they did this year.

Although amounts were light and the average for the State was the fourth lowest in the period of record for July, what precipitation fell was fairly well distributed with regard to area and frequency. The areas of deficient rainfall increased greatly, surpluses being confined chiefly to southwestern stations. Monthly totals below 1.00 inch were common in the southeast and there was an accumulated average deficiency, since the first of the year, of 1.14 inches. In the same period in 1943, a deficiency of 0.24 inch had been accumulated. The total precipitation for the last two months was below normal at most stations. Deficiencies range to 4.26 inches at Butler in the west, 5.28 inches at Hanover in the south-central section, and 5.36 inches at Conshohocken in the southeast, while surpluses exist in southwestern and north-central counties.

The most damaging storms, reported, occurred on the 16th and 26th. The first struck Scranton and vicinity, blowing down trees, breaking electric wires, and blocking traffic. Telephone and light services were interrupted for brief periods. The Weather Bureau Office recorded the highest July wind velocity since the station was established in 1900. The storm of the 26th occurred at Waynesboro and was accompanied by violent wind, which unroofed buildings and blew down trees. Utility lines were hard hit and some sections of the community were without service until the following day. According to a local newspaper account, "Hundreds of trees were damaged. Some were twisted off at the roots, others uprooted, some had the top blown out while others were stripped of their limbs and foliage. Some trees were lifted out of the ground and deposited some distance away. Big trees were split and shattered."

The prospects for increased crops, prevalent at the end of May, have dwindled and estimates of corn, potato, and tobacco yields have been sharply reduced. G. W. S.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 83 stations was 72.2°, which is the 57-year normal for July. The highest monthly mean was 82.0° at Marcus Hook, and the lowest was 64.9° at Kane. Extremes ranged from a maximum of 100° at Hewitt on the 12th and at Phoenixville on the 27th, 28th, and 31st, to a minimum of 37° at Kane on the 17th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 204 stations, was 2.39 inches, which is 1.87 inches below the 57-year normal for July. The greatest monthly amount was 5.19 inches at Lycippus, while the least was 0.05 inch at Conshohocken. The greatest amount recorded in any 24 consecutive hours was 2.42 inches at Indiana on the 12th.

ERRATA

May, 1944. - Page 34, Clarion, lowest minimum should be 36 on 1st. Page 37, Evaporation Table, Wallenpaupack, total evaporation should be 5.048.

June, 1944. Page 42, Pittsburgh Airport, greatest precipitation in 24 hours should be 1.11 inches on the 18-19th.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. ‡‡ Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
a, b, c, etc. Number of days missing, for example, b indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

1 Midnight to midnight.
2 Measured in the morning for the preceding 24 hours.
3 Data for 24 hours ending at 1:30 a. m. of the following day.
4 Best available used for stations not equipped with recorders.
5 Recording gage.
6 At a fixed hour between sunset and 11:00 p. m.
7 Noon to noon.

List of Changes in Station Designations

For more exact location of the equipment, station names have been changed as follows:

Dauphin	formerly	Peters Mountain Tower
Ford City	"	Crooked Creek Dam
Grantville	"	Manada Gap
Jamestown	"	Pymatuning Dam
Kregar	"	Laurel Hill Tunnel
McConnellstown	"	Loop Mountain Tower
Milroy	"	Penn Nursery
Monroeton	"	Kellogg Mountain Tower
Neffs Mill	"	Charter Oak
Newburg	"	Blue Mountain Interchange
Putneyville	"	Mahoning Dam
Sheffield	"	Cherry Grove
Williamsport 4 SE	"	Shaffers Path

CLIMATOLOGICAL DATA

L. F. CONOVER

HARRISBURG, PA.

VOL. XLIX. AUGUST 1944. No. 8.

GENERAL SUMMARY.

This was the sixth driest August of record and the driest since 1930. Drought conditions continued to spread northward and intensify. Considerable areas in the south-central and southeast portions have accumulated deficiencies, during the growing season, ranging from 4.00 to 9.00 inches.

This was the warmest August in five years. The first half of the month was hot, most stations in the southeast recording temperatures of 90° and above every day from the 10th through the 17th. Eight deaths and eleven prostrations, attributed to the heat, were reported in the southeast during this period. The extreme maximum was the highest August temperature since 1933 and the highest temperature since July 28, 1941. Station maxima were generally the highest of the year. A decided reaction to cooler weather followed, culminating in lowest readings of the month about the 26th. New record minima for the month were established at Philadelphia, Quakertown, Harrisburg, and Johnstown, where the periods of record range from 51 to 73 years.

Generally, precipitation was frequent and well distributed but amounts were light. The accumulated deficiency for the year is now 2.75 inches and for the growing season, it is 2.07 inches. A tropical storm, sweeping up the coast, produced heavy precipitation in the extreme southeast about the 2d but, thereafter, that area received only light showers. Rain generally occurred in thundershowers and minor damage by wind and lightning was widespread. A severe thunderstorm struck the Lancaster area on the 7th. Roofs were blown from three houses, power lines were torn down, and a barn burned when struck by lightning. At York, wind ripped the roofs from a row of six houses on the 13th. Trees were uprooted and broken off and wires were torn down. One witness said that she saw a funnel cloud as the storm approached, but this statement has not been confirmed. On the same day, a girl near York was struck by lightning, and at Chambersburg, lightning caused four fires and considerable damage was done by the wind. Two men were stunned when lightning struck them at Newport on the 14th. Wind damage near Penn Line and in the southwestern counties was reported on the 16th and 23d, respectively.

The past summer was warm and dry. The average temperature, while slightly above normal, was 1.1° lower than the 1943 summer temperature. It was the driest summer since 1932 and the average was 1.05 inches lower than 1943's. Crop prospects were further reduced and many crops ripened prematurely. Wells and springs were going dry and fall plowing was delayed in most areas.

G. W. S.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 84 stations was 71.5°, which is 1.2° above the 57-year normal for August. The highest monthly mean was 79.0° at Marcus Hook, and the lowest was 64.5° at Philipsburg. Extremes ranged from a maximum of 103° at Marcus Hook on the 4th and 5th, Burnt Cabins on the 11th and 12th, and Phoenixville on the 13th, to a minimum of 30° at Kane on the 27th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 202 stations, was 2.56 inches, which is 1.61 inches below the 57-year normal for August. The greatest monthly amount was 6.33 inches at Braddock, while the least was 0.81 inch at Montrose. The greatest amount recorded in any 24 consecutive hours was 3.42 inches at Lancaster on the 7th.

ERRATA

July, 1944.—Page 50, George School, highest maximum should be 96° on 28th. Page 55, Philadelphia City Office, minimum temperature on 25th should be 76°, mean minimum should be 70.6°.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. ‡‡ Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T. , Trace (0.005 inch or less).
a, b, c, etc. Number of days missing, for example, b indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

1 Midnight to midnight.
2 Measured in the morning for the preceding 24 hours.
3 Data for 24 hours ending at 1:30 a. m. of the following day.
4 Best available used for stations not equipped with recorders.
5 Recording gage.
6 At a fixed hour between sunset and 11:00 p. m.
7 Noon to noon.

HARRISBURG, PA.

VOL. XLIX. SEPTEMBER 1944. No. 9.

GENERAL SUMMARY.

September was a pleasant month with temperatures slightly below, and precipitation somewhat in excess of normal. With the exception of a few mountain stations, temperatures and precipitation were above station normals in the east while in the west they were generally deficient. Consequently, drought conditions in the southeast were relieved while in west-central and south-central counties they continued to intensify. Highest temperatures occurred during the first few days when readings of 90° and above were common, particularly at eastern stations. Lowest minima were general about the 24th when sub-freezing temperatures were reported at many northern and mountain stations.

Precipitation, although unevenly distributed, was frequent and the State average was above normal, reducing the accumulated deficiency for the year to 2.30 inches. Only twice in the period of record for September has the number of days with measurable precipitation been exceeded. The stormiest period of the month was from the 12th through the 14th when more rain fell in eastern counties in 48 hours than had fallen during July and August. Precipitation reached excessive rates in this area and was attended by strong winds in Philadelphia and its vicinity due to the northward passage of a hurricane, close to the New Jersey coast. On the 14th, at Philadelphia, gust velocities of 60 miles per hour were recorded. Trees were blown down, power lines broken, and roads blocked, forcing detours of traffic. The force of the wind was enough to knock down and injure a woman. About 5200 telephones were put out of service in eastern Pennsylvania as a result of the rain and wind. In a local storm, near Carlisle on the 5th, wind tore part of the roof from a barn and blew down many trees. Power lines were torn down and roads were blocked. One man was stunned by lightning.

A tornado ripped its way through a section of Bucks County, a short distance northwest of Doylestown, on the 28th. The path was about 100 yards wide and six miles long. Barns and chicken houses were demolished, houses were unroofed, and many trees were blown down. Property damage was estimated at $50,000.

On the night of the 4-5th, many communities in the State were shaken by a slight earthquake, centered in the vicinity of Canton, New York.

Unfavorable weather conditions and labor shortage during the growing season were obstacles to this year's program to expand production. In spite of this, planted acreage was increased by 6%, only 2% below the desired goal. Precipitation was above normal throughout the Spring and delayed field work and planting. Temperatures during the summer were not exceptionally high but combined with the lack of precipitation to retard crop development in many localities. September's rain fell where it was most needed, but was too late to benefit crops, although pastures, soil condition, and wells were improved. Killing frosts were reported on the 24th at many northern stations, about a week in advance of the average for this section. G. W. S.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 84 stations was 63.4°, which is 0.7° below the 57 year normal for September. The highest monthly mean was 71.2° at Marcus Hook, and the lowest was 57.1° at Kane. Extremes ranged from a maximum of 100° at Phoenixville on the 2d to a minimum of 23° at Kane on the 24th

PRECIPITATION.

The average precipitation for the State as deduced from the observations at 208 stations was 3.85 inches, which is 0.45 inch above the 57-year normal for September. The greatest monthly amount was 8.07 inches at George School, while the least was 1.08 inches at McKeesport. The greatest amount recorded in any 24 consecutive hours was 3.90 inches at West Chester on the 12-13th.

ERRATA

July, 1944.—Page 56, Table of River Conditions, mean stage at Harrisburg should be 3.5 feet.

August, 1944.—Page 58, Emporium, departure of temperature from normal should be +1.7°; Palmerton, lowest temperature should be 41°. Page 60, Neffs Mill, precipitation on 28th should be 0.30 inch, on 29th, none. Page 62, Harrisburg, minimum temperature on 3d should be 71°. Page 63, Philadelphia Airport, minimum temperature on 2d should be 71°.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. †† Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

1 Midnight to midnight.
2 Measured in the morning for the preceding 24 hours.
3 Data for 24 hours ending at 1:30 a. m. of the following day.
4 Best available used for stations not equipped with recorders.
5 Recording gage.

CLIMATOLOGICAL DATA

L. F. CONOVER

HARRISBURG, PA.

VOL. XLIX. OCTOBER 1944. No. 10.

GENERAL SUMMARY.

Temperatures were highest about the 7th and 18th, extreme maxima being recorded at most stations on the earlier date. Killing frosts occurred in all sections on the 16th and, by the end of the month all but three stations had experienced subfreezing temperatures. The temperature deficiency further decreased the average daily excess, accumulated for the year, to 0.3°. In contrast to this, an average daily deficiency of 0.3° was accumulated during the same period in 1943.

Precipitation was confined, principally, to the first half of the month. A hurricane then threatened to duplicate the damage of September's violent storm. Instead of moving up the coast, however, it traveled inland over South Carolina where its further movement was retarded by a ridge of high pressure to the north. Losing its hurricane intensity, the storm continued its northward movement. Warm air, circulating about its center, over-ran the colder air to the north and produced heavy rain which ended on the 21st as the storm passed along the New Jersey coast. Amounts on the 20-21st accounted for approximately 45% of the month's precipitation. At southwestern and southern mountain stations, 24-hour amounts were excessive. Monthly totals were above normal in the southern half of the State from the Susquehanna Valley westward. Elsewhere, they were generally deficient, most stations in the extreme east portion receiving amounts less than 2.00 inches. The State average was below normal, making the accumulated deficiency for the year 2.43 inches, compared to 2.04 inches in the corresponding months of 1943. The first general snowfall occurred on the 27th although isolated stations reported flurries earlier in the month.

Thunderstorms occurred on scattered dates but were most widespread on the 7th. Heavy hail accompanied the storms in Centre and Franklin Counties, damaging fruit in the latter area. Wind damage was reported in Harrisburg and at Blacksville, Greene County. At the latter place, one building was unroofed, a score of trees were uprooted, and several buildings were damaged.

As a whole, October was a good month for agriculture. Conditions, during the first half of the month, were favorable to plant growth and most of the less hardy crops had been harvested before the killing frost of the 16th. The latter part of the month was ideal for field work. While the year has been warmer and drier than 1943, drought conditions were less general, being concentrated in southeastern counties. G. W. S.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 84 stations was 50.8°, which is 1.7° below the 57-year normal for October. The highest monthly mean was 57.4° at Marcus Hook, and the lowest was 44.2° at Kane. Extremes ranged from a maximum of 90° at Phoenixville on the 7th, to a minimum of 12° at Bradford on the 28th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 203 stations, was 3.14 inches, which is 0.13 inch below the 57-year normal for October. The greatest monthly amount was 5.67 inches at Lake Lynn, while the least was 1.03 inches at Stroudsburg. The greatest amount recorded in any 24 consecutive hours was 2.84 inches at Uniontown on the 20th-21st.

The average snowfall for the State was a trace, which is 0.2 inch below the 57-year normal. The greatest monthly snowfall was 0.5 inch at Titusville. The greatest fall for any observational day was 0.5 inch at Titusville on the 26th.

ERRATA

September, 1944.—Page 66, Clarion, number of days with .01 inch or more should be 12; Harrisburg, total precipitation should be 3.94 inches, departure should be +0.89 inch; Putneyville, date of minimum temperature should be 24th. Page 67, Austinburg, precipitation on 5th should be 0.10 inch; on 19th, 0.02; on 22d, 0.06; on 27th, 0.22. Amounts on 15th, 16th, 17th, 23d, 24th, 26th, and 30th should be deleted. Total should be 3.68 inches. Page 68, Harrisburg, precipitation on 14th should be 0.25 inch, total should

* Pool stage. † On other days also.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. ‡‡ Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

CLIMATOLOGICAL DATA

L. F. CONOVER

HARRISBURG, PA

VOL. XLIX. NOVEMBER 1944. No. 11.

GENERAL SUMMARY.

This was a typical November as the State temperature and precipitation averages deviated but little from their normals. A slight temperature excess was accumulated, maintaining the year's average daily excess at 0.3°. Extremes were well within the absolute values for the month and approximated those recorded in November, 1943, in spite of the fact that the average temperature for that month was 2.9° lower.

Precipitation was slightly below normal and the accumulated deficiency for the year is now 2.49 inches. It occurred more frequently in the west than in the east but daily amounts were generally lighter, only 2 western stations reporting maximum 24-hour precipitation in excess of 1.00 inch, and monthly totals were somewhat less at western stations. Greatest amounts fell during the latter part of the month. Thunderstorms were widely reported on the 15th but were most general in the southwest. The storm on the 20th produced the first significant snowfall of the season and the greatest 24-hour falls at most eastern stations. Cindering crews were called into action as roads, in northern counties, became dangerous. Moderate rains on the 27th and rain and snow on the 29-30th produced the greatest 24-hour measurements of the month at most eastern stations. Greatest 24-hour snowfall, from the mountains north and west, resulted from the latter storm.

November brought to a close an autumn which was nearly normal in all respects. Temperatures were somewhat deficient while precipitation and snowfall were slightly in excess. The western part of the State was cooler and drier than the eastern, but precipitation deficiencies accumulated during the critical summer months were too great to be overcome. The temperate weather which prevailed until mid-November permitted completion of harvesting and most outdoor work. Winter grains had obtained a good start. However, wells, springs, and streams were low, particularly, in the southeast and west-central counties. Precipitation during the latter half of the month alleviated this condition to some extent, although complaints were still received from west-central and northern stations.

G. W. S.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 84 stations was 41.6°, which is 0.3° above the 57-year normal for November. The highest monthly mean was 48.2° at Marcus Hook, and the lowest was 36.4° at Montrose. Extremes ranged from a maximum of 78° at Uniontown on the 2d, to a minimum of 7° at Somerset on the 26th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 200 stations, was 2.81 inches, which is 0.05 inch below the 57-year normal for November. The greatest monthly amount was 6.50 inches at George School, while the least was 1.26 inches at Saxton. The greatest amount recorded in any 24 consecutive hours was 2.00 inches at Marcus Hook on the 27-28th.

The average snowfall for the State was 3.2 inches, which is 0.5 inch above the 57-year normal. The greatest monthly snowfall was 17.0 inches at Lakeville. The greatest fall for any observational day was 12.0 inches at Canton on the 29-30th.

ERRATA

October, 1944.—Page 74, Phoenixville, total precipitation should be 2.26 inches, departure should be —1.00 inch. Page 75, Phoenixville, total precipitation should be 2.26 inches. Page 79, Philadelphia City Office, minimum temperature on 15th should be 44°, on 21st, 47°. Mean minimum should be 49.4°; Scranton, minimum temperature on 8th should be 54°. Page 80, Pressure, wind, humidity, and sunshine table, Degree days at Scranton should be 454.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. †† Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

1 Midnight to midnight.
2 Measured in the morning for the preceding 24 hours.
3 Data for 24 hours ending at 1:30 a. m. of the following day.
4 Best available used for stations not equipped with recorders.
5 Recording gage.
6 At a fixed hour between sunset and 11:00 p. m.
7 Noon to noon.

CLIMATOLOGICAL DATA

PENNSYLVANIA SECTION.

L. F. CONOVER

HARRISBURG, PA

VOL. XLIX. DECEMBER 1944. No. 12.

GENERAL SUMMARY.

The 2d snowiest and 7th coldest December of record left no doubts as to the arrival of winter. Snow, rain, and freezing temperatures created dangerous road conditions which contributed to the innumerable accidents reported. At least thirty deaths, resulting from overexertion, exposure, and accidents, were attributed to weather causes. Transportation and war production were hampered and many schools closed, temporarily. Highway crews, short of personnel and equipment, were kept busy cindering and plowing roads most of the month. The snowfall average was greater than in any month since February, 1926, and the average temperature was the lowest since January, 1943. Maxima were lower than in any December since 1935 and the extreme minimum, occurring during the cold wave which struck Pennsylvania on the 22d, was the 2d lowest of the period of record for the month. The year closed with an average daily deficieny of 0.2°, a drop of 0.5° since November 30th.

Above normal precipitation reduced the accumulated deficiency for the year to 1.79 inches. Only a few stations, principally in the east, reported totals below their normals. The most significant rain of the month fell on the 7-8th, after which precipitation was mostly in the form of snow. The storm of the 11-12th produced the greatest 24-hour snowfall of the month at western and many northern stations. According to a survey conducted by the Federal-State Flood Forecasting Service at Pittsburgh, snowfall averaged "16 inches over the Allegheny Basin. . .; 18 inches over the Monongahela. . .; and 12 inches over the Upper Ohio. . . ." Small communities were isolated and many secondary roads were blocked by drifted snow. Estimates of losses and expenses, incidental to this storm, range to $2,000,000 in the Pittsburgh district. To make matters worse, more snow fell on the 18-19th, producing greatest 24-hour measurements at most eastern stations. Warmer weather and rain, on the 25th, melted snow and ice, bringing the threat of flooding to western communities. However, temperatures fell that night, averting the danger, and minor damage was confined to the Monongahela Valley. Additional snow on the 27-28th added to the State's difficulties and a number of communities, particularly in the northwest, were still digging out of the snow as the month ended.

Adverse weather conditions during the month bore heavily on the farmer. Outdoor work was retarded, and the delivery of milk to plants was impeded by blocked roads in the north and west. Feeding of roughage was unusually heavy because of the severe weather. However, water supplies showed improvement, and the snow provided excellent protection for winter grains.

G. W. S.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 80 stations was 26.3°, which is 5.0° below the 57-year normal for December. The highest monthly mean was 35.2° at Marcus Hook, and the lowest was 20.5° at Black Moshannon Airport, Philipsburg. Extremes ranged from a maximum of 60° at Phoenixville on the 9th to a minimum of −26° at Kane and Black Moshannon Airport, Philipsburg, on the 22d.

PRECIPITATION.

The average precipitation for the State as deduced from the observations at 199 stations was 3.79 inches, which is 0.69 inch above the 57 year normal for December. The greatest monthly amount was 7.19 inches at Lycippus, while the least was 1.77 inches at Lawrenceville. The greatest amount recorded in any 24 consecutive hours was 2.50 inches at Corry on the 11-12th.

The average snowfall for the State was 22.6 inches, which is 14.7 inches above the 57-year normal. The greatest monthly snowfall was 76.5 inches at Corry. The greatest fall for any observational day was 26.5 inches at Erie on the 11-12th.

OBITUARY

Mr. Robert Tross, cooperative observer at Johnstown, Pennsylvania, died on December 29, 1944. His services began in October, 1933, and continued until the time of his death.

ERRATA

November, 1944.—Page 82, Curwensville, total snowfall should be 10.0 inches; Greensburg, mean temperature should be 42.1°, departure, −0.8°; Port Clinton, number of days with 0.01 inch or more should be 7; Springs, total precipitation should be 3.12 inches, departure, +0.18 inch; Tamarack, total snowfall should be 8.7 inches. Page 85, Springs, total precipitation should be 3.12 inches. Page 88, Pressure, Wind, Humidity, and Sunshine Table, average hourly wind velocity at Pittsburgh should be 9.7; Table of River Conditions, Wilkes-Barre, mean stage should be 3.3 feet.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. ‡‡ Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

1 Midnight to midnight.
2 Measured in the morning for the preceding 24 hours.
3 Data for 24 hours ending at 1:30 a. m. of the following day.
4 Best available used for stations not equipped with recorders.
5 Recording gage.
6 At a fixed hour between sunset and 11:00 p. m.
7 Noon to noon.

List of Changes in Station Designations

CLIMATOLOGICAL DATA

32 PENNSYLVANIA SECTION.
L. F. CONOVER.
HARRISBURG, PA.

VOL. XLIX. ANNUAL SUMMARY, 1944. No. 13.

GENERAL SUMMARY

Statistically, 1944's weather was about normal. The mean temperature was 50.0°, 0.2° below normal, while the annual precipitation, 40.22 inches, was only 1.79 inches deficient. Concealed in these figures are all possible combinations of weather, normal to Pennsylvania, with the most devastating system of tornadoes in the State's history thrown in for good measure.

After the driest winter of record, March and April were wet and unseasonably cool, retarding field work and planting. The hottest May of record accelerated the growth of vegetation, but rainfall continued above normal through June, keeping fields too wet for normal activity. Precipitation deficiencies, reported in the southeast in May and in west-central counties in June, grew worse and spread during the driest summer since 1932. By the end of August, communities south and east of the mountains had accumulated deficiencies for the growing season, ranging from 4.00 to 9.00 inches. Summer temperatures were not exceptionally high, which alleviated the drought conditions to some extent. Relief came to the southeast in September, too late to be of material benefit to most crops. Rainfall continued below normal at west-central stations for what remained of the growing season. Ideal weather permitted completion of most outdoor work by mid-November.

The snowiest December since 1890 brought the average snowfall for the year to 53.8 inches, the greatest since 1914. The snow which blanketed the unfrozen ground during the coldest part of the month provided excellent protection for winter grains and offered the prospect of improved soil conditions in 1945.

WEATHER BY MONTHS

JANUARY: Warm and dry, with most of the month's precipitation concentrated in the first week. Snowfall, averaging less than half normal, provided little protection for winter grains. Sleet, snow, and freezing rain on the 3d caused many minor accidents.

FEBRUARY: Mild and open, ending the driest winter of record. Snowfall, 60% of winter's total, was slightly deficient, leaving winter grains exposed to freezing temperatures. Slippery roads kept cindering crews active most of the month. Wind damaged property at Pittsburgh on the 22d.

MARCH: Cold and stormy with more precipitation than January and February combined, and the greatest monthly total snowfall of the season. Many accidents occurred on roads made slippery by snow, sleet, and freezing rains. High winds, general on the 29th, damaged property, particularly at Erie and in southwestern counties.

APRIL: Cool and rainy. The persistent cool weather continued to retard the growth of vegetation, and wet fields impeded plowing and planting. Roads near Meadville were inundated for a short time on the 13th.

MAY: Hot and wet, but with precipitation deficiencies beginning in the southeast. At Claysville on the 20th, there was minor flooding as the result of 1.85 inches of rainfall in one hour. Repeated storms caused a landslide which blocked the highway near Oil City on the 23d.

JUNE: Warm and continued wet. The extreme minimum, 29°, was the lowest June temperature recorded since 1933. Highest temperatures occurred on the 18th and 29th and, at scattered western stations, these were the extreme maxima for the year. Thunderstorms, reported on all but five days, were most general on the 19th and 23d. Damage to crops and property was reported from all sections of the State. Overshadowing all else were the tornadoes which moved across southwestern Pennsylvania on the night of June 23, killing 44 persons, injuring hundreds of others, and damaging property to the extent of an estimated $2,000,000.

JULY: Dry, except in the southwest. Wind caused minor damage at Scranton and Waynesboro. On the 16th, the wind velocity of 43 miles per hour set a new record for the month at Scranton. In a storm at Waynesboro on the 29th, winds were of tornadic action.

AUGUST: Warm and dry. Minima on the 26th were the lowest in more than 50 years at Harrisburg, Johnstown, Philadelphia, and Quakertown. At York on the 13th, a small tornado ripped the roofs from a row of six houses and caused additional minor damage. Lightning and wind damage were widespread throughout the month.

SEPTEMBER: Cool and wet. Property damage from rain and high winds was extensive in the east, during the passage of a hurricane, northward along the New Jersey coast, from the 12th through the 14th. A tornado damaged property in Bucks County on the 28th.

OCTOBER: Cool with precipitation about normal as a result of heavy rain on the 20-21st, when nearly half the month's total fell. Killing frosts occurred in all sections on the 16th.

NOVEMBER: Seasonable. The weather was favorable for outdoor work during the first half. The first significant snow of the season fell on the 20th and made roads, in northern counties, dangerous.

DECEMBER: Cold and stormy. Western and northern counties bore the brunt of repeated storms which piled up the greatest December snowfall in 54 years. The greatest individual total was 76.5 inches at Corry, by far the greatest of record for any month at that station. Conditions grew worse in the west as the snow drifted, blocking most secondary roads. Many communities were still snow-bound as the year ended. G. W. S.

ERRATA

December 1944.—Page 90, George School, mean temperature should be 30.4°, departure should be −3.2°. Page 94, George School, maximum on 31st should be 34°, mean maximum should be 38.6°. Page 95, Philadelphia Airport, maximum on 12th should be 47°, mean maximum should be 39.3°.

Departures, as shown on the various tables, incorporate all corrections to 1944 monthly issues of Pennsylvania Climatological Data.

CLIMATOLOGICAL DATA

PENNSYLVANIA SECTION

L. F. CONOVER

HARRISBURG, PA

VOL. L. JANUARY 1945. No. 1.

GENERAL SUMMARY.

Severe winter conditions experienced in western counties in the previous month gripped the whole State during January, and dispelled a prevalent belief that old fashioned winters were a thing of reminiscence. As this was the fourth snowiest and sixth coldest January of record, numerous periods of high winds combined to harass mankind and curtail war production by building great snowdrifts, disrupting all kinds of transportation, and bringing outdoor work to a standstill. Icy roads and streets kept automobile traffic at a minimum, but pedestrian accidents were unusually high. It is probable that there were more fractured bones reset than in any similar period. The snowfall, averaging 22.6 inches, equalled the December fall, and brought the total for the winter to 45.2 inches, the greatest for any two consecutive months in the period of record.

The storm of the 15-16th in the eastern portion of the State caused six deaths and was the worst of the month, and of particular note in the vicinity of Harrisburg, where 21.0 inches of snow fell in 24 hours, the greatest fall of record. Except at Gouldsboro, 24-hour depths were generally less, but highway crews were unable to keep roads clear. Transportation was slowed to a crawl, and production was impeded as workers were unable to get to work. Two collieries in Pottsville shut down, and schools cut their sessions short so the children could get home. Many rural schools remained closed for the balance of the week as the snow drifted, on the night of the 16th, and blocked many roads which, until then, had been passable.

Wind and cold were governing factors for the balance of the month, as the snow drifted repeatedly and limited progress in reopening roads. As the month closed, highway crews had reopened all but 5% of the rural roads in the southwest, but in northern counties 60% remained impassable. The severe weather during the latter half had serious consequences as householders kept fires roaring to combat the cold and wind. The unusual strain on the heating systems caused many serious fires, which resulted in a number of deaths. In rural areas, firemen could not get their apparatus through the blocked roads, and the homes were burned to the ground.

Snow melt and moderate rain caused minor flooding on the Monongahela on the 2d. A slight rise on the lower Susquehanna caused some ice movement and backwater, due to ice jamming in the vicinity of Columbia, forcing the water company to close down for four days, due to a stage only one foot below the crest of March 1936. Restrictions on the use of water from the limited reserve forced vital war industries in the area to suspend operation.

Farm activities were limited to chores during January, but the heavy snow cover provided excellent protection for winter grains and new grass seedings.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 84 stations was 20.4°, which is 7.8° below the 58-year normal for January. The highest monthly mean was 29.0° at Harrisburg Airport, and the lowest was 12.9° at Kane. Extremes ranged from a maximum of 58° at Marcus Hook and Philadelphia Airport on the 1st, to a minimum of −28° at Kane on the 25th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 197 stations, was 2.68 inches, which is 0.48 inch below the 58-year normal for January. The greatest monthly amount was 5.45 inches at Montrose, while the least was 1.04 inches at Jamestown. The greatest amount recorded in any 24 consecutive hours was 2.54 inches at New Park on the 16th.

The average snowfall for the State was 22.6 inches, which is 12.0 inches above the 58-year normal. The greatest monthly snowfall was 57.7 inches at Montrose. The greatest fall for any observational day was 21.0 inches at Gouldsboro and Harrisburg on the 15-16th.

* Pool stage. † On other days also.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. ‡‡ Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.

U. S. DEPARTMENT OF COMMERCE, WEATHER BUREAU

CLIMATOLOGICAL DATA

32 PENNSYLVANIA SECTION

L. F. CONOVER

HARRISBURG, PA.

VOL. L. FEBRUARY 1945. No. 2.

GENERAL SUMMARY.

February's weather was an anti-climax to the preceding month of the meteorological winter just ending. During the month, pressure systems began moving more to the north of Pennsylvania and as a result, the snowfall was slightly below normal and the temperature somewhat above the average. Nevertheless, the accumulated snowfall, December, January, and February of 53.7 inches, just equalled the record set in the winter of 1909-1910 and the average temperature was the seventh lowest of record, all-told, one long to be remembered.

At the beginning of February, numerous primary and a great number of secondary roads were closed by drifting and winter held a tight grip upon the State until the 6th and 7th. Great anxiety was felt by the public, as the prospects of disastrous flooding seemed imminent due to the extremely heavy snow cover existing. Fortunately, there was a period of 10 days with mild, open weather and by the 16th much of the snow in the valleys in the lower half of the State melted slowly and percolated into the ground without resulting in much run-off, since most of the ground was frost-free, having been protected from freezing by the snow blanket.

Spring-like weather was terminated abruptly on the 17th, in time to check heavy run-off from the deep snow cover of the northern counties, which was ready to release its burden of water with only a little additional heat. Winter's return was of short duration and by the 22d, warmer weather began melting the snow cover again. From this run-off most of the ice moved out of the Allegheny River, except its upper portion and some movement occurred in the Susquehanna River Basin. Although the ice was not extremely heavy, river stages were too low to carry the ice burden and jams formed notably at Kinzua, Hyman, and in the vicinity of Columbia and Marietta. No trouble occurred on the Delaware River as ice cutters opened a channel to Trenton on the 20th. Continued warm weather and moderate rainfall produced additional runoff on the 27th and 28th with a crest not quite 3 feet over flood stage at Pittsburgh and under bankful elsewhere, except backwater due to the heavy ice jam in the vicinity of Columbia-Marietta was a little more than one foot higher than the 1936 stage at that point.

As the month closed, a few secondary roads were still blocked by drifted snow of the hard winter but most of the ground was bare. Ground water was satisfactory, having been replenished by the melting snow. Farm work was way behind schedule but from appearances, the agricultural outlook was most promising.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 83 stations was 29.1°, which is 0.7° above the 58-year normal for February. The highest monthly mean was 36.8° at Marcus Hook, and the lowest was 22.8° at Montrose. Extremes ranged from a maximum of 71° at Uniontown on the 15th, to a minimum of −14° at Coudersport, Lawrenceville, Phoenixville, and Somerset on the 4th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 203 stations, was 2.66 inches, which is 0.15 inch below the 58-year normal for February. The greatest monthly amount was 5.31 inches at Portland, while the least was 1.26 inches at Burnt Cabins. The greatest amount recorded in any 24 consecutive hours was 1.95 inches at Portland on the 8-9th.

The average snowfall for the State was 8.5 inches, which is 2.1 inches below the 58-year normal. The greatest monthly snowfall was 27.5 inches at Corry. The greatest fall for any observational day was 10.0 inches at Dingmans Ferry and Hawley on the 8-9th.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. †† Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

1 Midnight to midnight.
2 Measured in the morning for the preceding 24 hours.
3 Data for 24 hours ending at 1:30 a. m. of the following day.
4 Best available used for stations not equipped with recorders.
5 Recording gage.
6 At a fixed hour between sunset and 11:00 p. m.
7 Noon to noon.

List of Changes in Station Designations

For more exact location of the equipment, station names have been changed as follows:

Dauphin	formerly	Peters Mountain Tower
Farrell	"	Sharon
Ford City	"	Crooked Creek Dam
Grantville	"	Manada Gap
Jamestown	"	Pymatuning Dam
Kregar	"	Laurel Hill Tunnel
McConnellstown	"	Loop Mountain Tower
Milroy	"	Penn Nursery
Monroeton	"	Kellogg Mountain Tower
Neffs Mill	"	Charter Oak
Newburg	"	Blue Mountain Interchange
Putneyville	"	Mahoning Dam
Sheffield	"	Cherry Grove
Tyrone	"	Bald Eagle
Williamsport 4 SE	"	Shaffers Path

L. F. CONOVER

HARRISBURG, PA.

VOL. L. MARCH 1945. No. 3.

GENERAL SUMMARY.

Spring was a month early this year, as March equalled the previous warmest of record and was as warm or warmer than 44% of all April records! Rains—it was wetter than normal—and the warm weather, causing the remaining snow cover to melt, produced rapidly fluctuating stream levels during a good portion of the period. New snowfalls were conspicuously absent, and the average was only 25% of normal. The month was a marked reaction to the arduous winter.

Mild weather continued from late February, and March came in like a lamb. Streams were still full. At Pittsburgh, stages were falling below flood levels, but on the Susquehanna River, ice from Columbia and Marietta, jamming in the Safe Harbor Pond at Turkey Hill, caused backwater several inches higher than the record 1904 level. Rains and melting snow on the 3d brought new flood peaks with a crest of 26.9 feet (about 2 feet above flood stage) at Pittsburgh, and well under bankful on the Susquehanna River, but sufficient to relieve the ice jams and restore vital freight service on the Pennsylvania Railroad lines below Columbia that had been interrupted since the 1st.

Heavy rains on the 6th and 7th caused still another flood rise, but only to a significant crest (33.4 feet) at Pittsburgh. Stages were retarded sharply at this time due to a brief interlude of cold air, the coldest of the month, although barely below normal.

Beginning with the 9th, temperatures began to climb and it is probable that the period from the 14th to the 20th was the warmest mid-March week of record, throughout the State the mean temperature averaging 21° above normal, and 29° on the 16th. Rivers began rising from snow melt on the 17th, and by the 22d, precipitation, falling mostly as rain, caused a new flood threat, but rapidly falling temperatures and a moderate snowfall lessened runoff with crests on the 23d generally under bankful. There was an immediate return to spring-like weather. On the 25th, spinach was reported being cut, the earliest on record. On the 26th in the west, and the 29th in the east, the afternoon maxima for most stations were the highest ever recorded in March, although the maximum, 91° at Marcus Hook, fell 1° short of the State record of 92° established in 1907. Vegetation was now three weeks to a full month ahead of normal, plowing and planting were under way, and farmers are looking at the season ahead with bright prospects.

The month closed violently with thunderstorms leaving a path of destruction across the State, and two deaths in the Philadelphia area. The adage of the lamb and lion was verified.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 85 stations was 48.0°, which is 10.3° above the 58-year normal for March. The highest monthly mean was 55.8° at Marcus Hook, and the lowest was 41.6° at Kane. Extremes ranged from a maximum of 91° at Marcus Hook on the 29th, to a minimum of 5° at Bradford and Ridgway on the 8th and 1st, respectively.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 203 stations, was 3.88 inches, which is 0.35 inch above the 58-year normal for March. The greatest monthly amount was 8.96 inches at Schenley, while the least was 1.39 inches at Doylestown. The greatest amount recorded in any 24 consecutive hours was 2.68 inches at Kregar on the 6th.

The average snowfall for the State was 2.1 inches, which is 5.7 inches below the 58-year normal. The greatest monthly snowfall was 14.5 inches at Bradford. The greatest fall for any observational day was 11.0 inches at Bradford on the 22d.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. ‡‡ Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[1] Midnight to midnight.
[2] Measured in the morning for the preceding 24 hours.
[3] Data for 24 hours ending at 1:30 a. m. of the following day.
[4] Best available used for stations not equipped with recorders.
[5] Recording gage.
[6] At a fixed hour between sunset and 11:00 p. m.
[7] Noon to noon.

VOL. L. APRIL 1945. No. 4.

SUBSCRIPTION PRICE: 25 CENTS PER ANNUM; (NOT STAMPS).
REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS WASHINGTON, 25 D. C.

GENERAL SUMMARY.

Vegetation's phenomenal start in March continued through the first half of April (which averaged about 11° above normal) and well-founded anxiety grew as to the prospects of damaging frosts. The average last killing frost in spring occurs, in the southeastern counties, about April 10 and ranges to as late as early June in Potter County, but the most common date for the State as a whole, is May 8. Conditions were too ideal and a reaction to cold, wet weather prevailed for the latter half of the month, with at least one hard freeze general in most localities, except the southeast counties.

At the beginning of the month, a brief change of airmass, from warm to cold, set off rather severe thunderstorms on the 4th, during which high winds caused some damage in the southwest. A six-family row house at Crescent Heights, Washington County, was unroofed and moved from its foundation. Trees were blown down and electric service was interrupted. Work was halted in Monessen due to power failure. One storm followed a path from Murrysville to Tunnellton, blowing down trees and resulting in minor damage to property. Lowest temperatures of the month occurred on the 5-6th and justified earlier anxiety about frosts. This was the first time since early March that daily temperatures fell below normal. Hail fell on the 5-6th at scattered stations.

Temperatures rose again during the following week and were climaxed by highest readings of the month about the 13th. An unusual feature was the fact that, at many eastern stations, April's extreme maxima were lower than those of March. New record maxima for the day were set at Pittsburgh on the 10th, and at Harrisburg on the 13th. By the latter date, dogwood was blossoming at Valley Forge, more than a month early.

The balance of the month was cool and wet. Minor storm damage occurred at Reading on the 14th, where a new record maximum wind velocity for April was established. The 19-23d was the longest period during which temperatures were below normal since mid-February, and the closing days of the month were cooler, relatively, than any period since January. Frost was reported on the 20th at southwestern stations, and more generally on the 23d. On the latter date, fruits and vegetation, which were not far advanced, were injured. Hail fell at Coatesville on the 14th, and on the 20-21st chiefly in the southwest. Damage from hail was reported near Philadelphia on the 22d and scattered localities reported occurrences on the 26th. Wind damaged property in the Philadelphia area on the 27th.

Agricultural prospects were bright as the month began, but frosts nullified the rapid progress which continued until the 14th. The frost on the 23d was the most damaging. Fruits were hard hit, and prospects were reduced one-half. Cherries suffered most, many orchards being a complete loss. Although the latter part of the month was unfavorable, cool, and wet, spring plowing and planting were ahead of the average, and were about twice as far advanced as they were last year at this time.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 82 stations was 52.4°, which is 3.8° above the 58-year normal for April. The highest monthly mean was 59.7° at Marcus Hook, and the lowest was 46.6° at Kane. Extremes ranged from a maximum of 90° at Marcus Hook on the 14th, to a minimum of 18° at Springs on the 6th.

PRECIPITATION.

The average precipitation for the State, as deduced from the observations at 193 stations, was 4.17 inches, which is 0.72 inch above the 58-year normal for April. The greatest monthly amount was 6.67 inches at South Mountain, while the least was 1.93 inches at Covington. The greatest amount recorded in any 24 consecutive hours was 1.92 inches at Doylestown on the 25th.

The average snowfall for the State was a trace, which is 2.2 inches below the 58-year normal. The greatest monthly snowfall was 1.6 inches at Kane. The greatest fall for any observational day was 1.2 inches at Kane on the 5th.

ERRATA

March, 1945.—Page 20, Middletown, precipitation on 5th should be 0.05 inch.

FOOTNOTES

Figures and letters following stations indicate distance in miles and half miles and direction of station from City Post Office.

All departures from normal are computed from the averages of the entire period for stations having 10 or more years of record, except that for First-Order Weather Bureau Stations they are based on adopted normals. ‡‡ Precipitation normals or "standard mean" adjusted to a uniform 35 year period.

Except as otherwise indicated precipitation and temperature readings are for 24 hours ending late in afternoon.

T., Trace (0.005 inch or less).
[a], [b], [c], etc. Number of days missing, for example, [b] indicates two days missing.
Italics, data interpolated.
§ Partly interpolated.
§§ Incomplete.
† And other dates.
†† Daily amounts inconsistent.
‡ Received too late to be included in means and summaries.
* Included in next measurement.
// Windshield on gage.
/ Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

1 Midnight to midnight.
2 Measured in the morning for the preceding 24 hours.
3 Data for 24 hours ending at 1:30 a. m. of the following day.
4 Best available used for stations not equipped with recorders.
5 Recording gage.
6 At a fixed hour between sunset and 11:00 p. m.
7 Noon to noon.

List of Changes in Station Designations

For more exact location of the equipment, station names have been changed as follows:

REMIT DIRECTLY TO SUPERINTENDENT OF DOCUMENTS, WASHINGTON, 25 D. C.

GENERAL SUMMARY.

There was plenty of action in May, although the weather held to the pattern set the latter half of April, with wet, cool, and somewhat dismal conditions. The contrast between the pleasant start spring had in March, and its close in May, was very marked, but the three months averaged about 7° above normal, due to the impetus of the warm March. These same months were more than 2 inches too wet for normal.

May opened with a moderate snowstorm in the north-central counties, and someone aptly remarked that "it was a short summer." Heaviest fall was 9.5 inches at Kellogg Mountain Fire Tower, Bradford County, but traces were reported southeast to Berks, Dauphin, and Perry Counties. Cold air associated with the snow caused some damage to vegetation, as temperatures were below freezing the following morning. Two days later, light snow was again reported from north-central counties.

Mr. Dixon R. Miller, observer at the East Waterford Airway Station, taking an observation at 3:36 a.m. EWT, May 4, under leaden skies, noticed "a mysterious early morning flash which lit up the sky as bright as a very close lightning discharge. First it appeared not as a flash, but more slowly as that of an approaching meteor disintegrating upon entering the earth's atmosphere. Then, there were two or three consecutive flashes as of a meteor splitting up and exploding. Heavy fog obscured the sky and diffused the light over the entire hemisphere. The display had a greenish hue, and was about three seconds duration." Mr. Miller observed a bolide, or disintegrating meteor, falling to earth at some point, probably east of the Jersey Coast, the noise of which was plainly heard in the Philadelphia area.

The first decade of the month closed with 2 to 4 inches more snow at some stations in north-central counties, helping to make this the snowiest May since 1923. Frost and freezing temperatures were reported on the 11th, but warmer weather set in with above-normal temperatures continuing through the 18th. Thunderstorms, some very heavy, occurred during this helpful warm spell. On the 15th, a storm of cloudburst proportions sent streams over their banks in northern Berks County, and on the following day, a circus tent collapsed during a windstorm at Greensburg, but 3,500 spectators escaped unhurt.

The observer at State College, Dr. Hans Neuberger, Chief, Division of Meteorology at the College, reported the details of a tornado which struck Centre County on May 17, between 3:30 and 3:45 p.m. EWT, and caused about $100,000 damage. The first evidence was found 1.5 miles east of Boalsburg, then traveling northeastward, passed through Center Hall and ended 1.5 miles southwest of Penns Cave, a path 9 miles long. No loss of life occurred, but there were some minor injuries. Two farm houses and three barns were leveled with many other structures damaged.

A cold front, moving eastward on the 22d, set off violent thunderstorms, attended by high winds, causing widespread damage across the state. Two days later, killing frosts occurred in the mountains. On the 28th, another cold front crossed the state with attending thunderstorms. Hail and heavy rains contributed to damage in this series of storms.

The fine start vegetation and farm work achieved at the beginning of the season was mostly overcome by the cool, wet weather of May, and frosts, which have wiped out many fruit crops. Much replanting was necessary. Sunshine and warmth are needed badly.

TEMPERATURE.

The average temperature for the State as deduced from the reports of 83 stations was 55.7°, which is 4.0° below the 58-year normal for May. The highest monthly mean was 75.3° at Phoenixville, and the lowest was 36.1° at Kane. Extremes ranged from a maximum of 91° at Phoenixville on the 15th and 16th, and Hewitt on the 21st, to a minimum of 18° at Kane, on the 2d.

PRECIPITATION.

The average precipitation for the State as deduced from the observations at 202 stations was 5.12 inches, which is 1.20 inches above the 58-year normal for May. The greatest monthly amount was 8.49 inches at Millersburg, while the least was 2.65 inches at Holtwood. The greatest amount recorded in any 24 consecutive hours was 2.62 inches at Claysville on the 16-17th.

The average snowfall for the State was 0.3 inch, which is 0.3 inch above the 58-year normal. The greatest monthly snowfall was 16.0 inches at Monroeton. The greatest fall for any observational day was 9.5 inches at Monroeton on the 1st.

ERRATA

April, 1945.—Page 26, Bradford, total snowfall should be 0.8 inch. Montrose, mean temperature should be 47.6°. Mt. Pocono, mean temperature should be 47.8°.
